	<b>Appendix D: Aircraft type inspections .....</b>	<b>110</b>
	<b>Appendix E: Ratio per item.....</b>	<b>116</b>

## Executive summary

The Agency changed the format of the report in order to provide more and better analysis of the collected data, to draw conclusions and to issue recommendations for the continuous improvement of the EU Ramp Inspection Programme. Addressing two years in a single report also allowed for a comprehensive feedback on two major multi-annual projects (Manufacturer data and System Wide Coordination) which were finalised in 2019.

The added safety value of the ramp inspection programme becomes clear from two elements in this report: First of all, the data analysis shows a global continuous improvement of the SAFA ratio since the end of 2016, indicating structural improvements implemented by the operators following earlier findings. Secondly, the centralised establishment of risk-based inspection targets led to better balanced inspection numbers depending on the operator's risk footprint.

Amongst others, the report includes the following main conclusions and recommendations.

- The analysis of data shows that an enhanced visibility in other continents leads to better data and, that for that reason, the further expansion of the programme should prioritise such enhancement.
- The process to establish the list for the prioritisation of inspections needed a further review and amendment to address certain flaws. The enhanced process should lead to a shorter but more effective priority list.
- The most important indicator of the programme, the "SAFA ratio", is very sensitive to specific situations with a low number of inspections on an aircraft, especially if the number of inspected aircraft is limited. The analysis methodology in general, but specifically the calculation of the SAFA ratio should be improved.
- The report identified that most major findings are raised for the cargo inspection items and this information will be used as a pilot case to establish a follow-up process addressing areas of concern.

## 1 Introduction

ARO.RAMP.155 is requiring the Agency to submit an annual report on the ramp inspection programme to the European Commission and, in addition, ARO.RAMP.160 calls for the publication of an annual information report for the public; this report is combining the two.

In 2018, the Annual Report for the EU Ramp Inspection Programme (further referred to as “the Programme”) covering the period from 2013 to 2017 was published in the form of an Aggregated Information Report. In 2019, EASA intended to resume the publication of the report on an yearly basis; nevertheless, this report is encompassing 2018 and 2019, as consequence of the significant changes expected following the different working groups and ramp simplification process that were in progress.

During the SAFA Regulators and Industry Forum held in March 2019, it was discussed if the report could be better adapted to the expectations of the stakeholders outside the EASA’s premises. Feedback on topics like the usefulness, adequacy of information and data, simplicity of use, etc., were requested to be reported by end of June; by the lack of feedback it was decided internally to proceed with a revision of the content to provide a more user friendly and useful document, still maintaining adherence to the ARO.RAMP.155 and ARO.RAMP.160 requirements. The internal discussion on the improvements to the report in conjunction with other demanding tasks, led to the composition of this document covering the years 2018-2019. For some tables a previous year was added for reference purpose.

The main enhancements of this revision are to:

- provide a status update of the Programme together with the resources allocated;
- improve the analysis based on factual information;
- provide information on the conclusions drawn including the identification of strengths and weaknesses;
- issue recommendations to address the weaknesses and reinforce the strengths; and
- provide an update on developments stemming from regulatory changes or previous recommendations.

These enhancements are a first step to continuously improve the structure of the annual report, whereby the feedback received by all report’s recipients will be taken into account.

This report avoids to explain the functioning of the EU ramp inspection programme; for this, readers are invited to read the comprehensive information page on EASA’s Website (<https://www.easa.europa.eu/home>).

## 2 Staffing for Ramp Inspection Coordination and Standardisation activities

In 2018 and 2019, for RAMP coordination activities 3.5 FTEs and one full time Seconded National Expert (SNE) were available.

For standardisation activities in the RAMP domain, there were 2.2 FTE standardisation team leaders, which were partly involved in coordination activities.

## 3 Agency coordination tasks

EASA shall manage and operate the tools and procedures necessary for the storage and exchange of information collected by the Programme. The main means used by EASA to satisfy this requirement are presented in this chapter.

### 3.1 International exchange of information

In accordance with ARO.RAMP.150, EASA shall liaise with other third countries' authorities to facilitate, the improvement of civil aviation safety in Europe through the collection and exchange of aviation safety data.

For that aim, EASA concluded working arrangements with third countries to ensure close international cooperation to strengthen the Programme and enlarge its scope whilst maintaining a harmonised approach to the effective enforcement of international safety standards.

#### 3.1.1 Programme expansion

States with a well-established aviation authority in place, having international traffic, and where there is a mutual interest in participation might become eligible to become a Candidate State (CDT) by signing a Working Arrangement (WA). To that end, EASA maintained contacts with the following potential CDTs: Azerbaijan, Qatar, Japan, USA, Brazil, and South Africa.

Candidate States will become full Participating States after a successful initial standardisation visit; as of that moment, they obtain full access to the ramp inspection data and their inspection results are taken into account for the ramp inspection data analysis. Australia became a full Participating State at the end of 2018.

In early 2019, Azerbaijan and EASA signed a Working Arrangement (WA). From 7 to 11 October 2019 the EaP/CA project supported a Ramp support mission (Gap Analysis visit) to Azerbaijan to establish Azerbaijan's level of compliance to EU regulation 965/2012 PART.ARO.RAMP. This activity included delivery of proposals and recommendations towards incompliances observed during the desktop audit and the observed ramp inspections at the airport of Baku international.

At the end of 2019, 49 States participated in the Programme although 2 of them were not actively performing inspections.

### 3.1.2 International cooperation

From the 20<sup>th</sup> to the 25<sup>th</sup> September 2018 “The EU-China Aviation Partnership Project” (APP) successfully concluded an experience exchange visit to Europe dedicated to the ramp inspection data analysis and exchange. This activity increased the mutual understanding between EASA and CAAC regarding their respective ramp inspection systems, and highlighted areas where more similar approaches to ramp inspection procedures, categorisation of the findings and follow-up activities could potentially be adopted.

From the 3<sup>rd</sup> to the 5<sup>th</sup> July 2018, “the EU - South Asia Aviation Partnership Project” organised a SARI EASA ramp inspection Seminar in Malé, Maldives. This seminar included a training session conducted by a mix of SARI and EASA experts on ramp inspection programmes. This seminar was repeated a second time with a larger group of participating SARI States (27 - 29 August 2019). Establishing a regional ramp inspection programme in South Asia would be a natural extension of harmonised airworthiness rules under the South Asia Regional Initiative (SARI) and would offer region-wide safety benefits. Further support will be offered under the EU-South Asia Aviation Partnership Project to assist the region in realising this goal.

The ARISE Plus Civil Aviation Project has organised 3 activities on establishing and implementing a framework to share foreign operator ramp inspection information between the ASEAN Member States, AFOSA Programme. These three activities where EASA ramp inspection Experts have participated are:

- AFOSA workshop 1: to review procedures, develop a harmonised approach to training, assess flexible data exchange and analysis methods, Singapore on 23 – 25 October 2018;
- AFOSA workshop 2: to review the implementation of procedures, present the future database and to propose the training programme, Bangkok, Thailand on 29 – 31 January 2019; and
- AFOSA workshop 3: training session for qualified inspectors, Singapore on 2 – 4 July 2019.

“The EU-Latin America and Caribbean Aviation Partnership Project (EU-LAC APP)” organised workshops in Latin America and the Caribbean area in 2018 and 2019 to present an up-to-date overview of the EU Ramp Inspection Programme.

- In Costa Rica (5 - 8 March 2018), Participants came from Central America and the Caribbean (Antigua & Barbuda, Belize, Costa Rica, Cuba, El Salvador, Guatemala, Guyana, Honduras and Nicaragua).
- In Sao Paulo, Brazil, (22 - 25 July 2019). 14 inspectors of ANAC Brazil attended this workshop.
- In Buenos Aires, Argentina, (15 - 19 October 2019). 15 ANAC inspectors attended this workshop.
- In Colombia (12 and 14 November 2019), a dozen of Colombian inspectors attended this workshop.

## 3.2 Ramp inspection tool

As required by ARO.RAMP.150, EASA has to develop, maintain and continuously update a centralised database containing the ramp inspection reports provided by the Participating States. This centralised database is hosted by EASA in the ramp inspection tool.

### 3.2.1 Database statistics

*Table1: Number of active organisations and registered number approved before the 31<sup>st</sup> December 2019*

ramp inspection tool status end 2019	active organisations	registered users within
<b>EASA Member States</b>	31	512
<b>non-EASA Participating States</b>	17	177
<b>Candidate States</b>	1	6
<b>Guest States</b>	74	303
<b>Operators</b>	1 445	3 151
<b>Others organisations</b>	3	87

The ramp inspection tool allows to register different types of organisations associated with different access rights. The national aviation authority of each State can grant access rights to users and manage their account. Participating States with the full membership status (both EASA and non-EASA States) have unrestricted access to the data entered into the database (inspections reports, findings and other information from the follow-up). Candidate States have access only to their ramp inspections reports and reports concerning their operators. Guest States have access to reports concerning operators under their oversight only. Operators have access to reports concerning their fleet. The “Others organisations” are EASA, the European Commission and ICAO.

At the end of 2019, 1 571 different organisations were registered in the ramp inspection tool and 4 236 users had access to the ramp inspection tool. Most of them were operators and associated users, as shown in figure 1.

Figure 1: User statistics (2019 overview)

The graph above details the activity of users per week. About 800 distinct users were connected weekly on the ramp inspection tool; the weekly activity was stable along 2019. The most active group is the operators' one, usually between 450 and 500 active users weekly. Participating States (EASA and non-EASA) is the second most active group with some 250 active users weekly. Other organisations group have a non-significant, weekly activity.

### 3.2.2 Ramp inspection tool enhancement

A project charter was initiated in 2017, to plan for a complete redevelopment of the ramp inspection tool. This charter was finalised in May 2018 and established the criteria for the contract negotiations with the vendor. However, at that time EASA released its project for an Agency-wide modular IT framework, on which all EASA applications should be based. As a result, the redevelopment of the ramp inspection tool was put on hold until the framework can accommodate the tool.

Knowing that the current version of the ramp inspection tool is to be phased out, only essential changes are applied to the tool. Such essential change was the support for inspection trading, allowing the States to find partners to enter into a trade of inspection targets in the ambit of the System-Wide Coordination (SWC) process (see chapter 4.2.2.2) and to register such trade. This change was rolled-out on 2 August 2019.

EASA is using a separate application to extract data from the database and create reports which are sent automatically to all Participating States based on a schedule. Such a report has been developed to inform the States involved in SWC on the progress towards the inspection targets. Following the release of the before mentioned inspection trading feature, this report has been enhanced to show the progress towards the inspection targets of all States, to allow States to identify which other States might be interested in a trade of inspections. At the same time, any registered trade in the ramp inspection tool amends the targets mentioned in the report.

### 3.3 Regular data analysis

EASA performs twice a year an analysis of the centralised database and other relevant information concerning the safety of aircraft and of air operators and, on that basis:

- (i) advises the Commission and the competent authorities on immediate actions or follow-up policy;
- (ii) reports potential safety problems to the Commission and the competent authorities; and
- (iii) proposes coordinated actions to the Commission and the competent authorities, when necessary on safety grounds, and ensure coordination at the technical level of such actions.<sup>1</sup>

EASA deems it useful to perform an in-depth analysis of certain operators, to get more information on the main areas of concern and the magnitude of the safety issue. For this, the data in the database on these operators have to be reviewed at an individual finding level.

This analysis is performed with a group of experts to prevent a “tunnel view” during the In-Depth Expert Analysis (IDEA) meeting. Members of this group are selected by EASA among:

- (i) a pool of experts designated by the EASA Member States;
- (ii) a representative of the Third-Country Operator (TCO) authorisation team (for the TCO operators’ analysis); and
- (iii) technical experts from EASA involved in the standardisation activities (for EASA operators and maintenance organisations).

Taking into account the IDEA analysis, EASA issues advises or proposals to both the Commission and to the EASA Member States. The possible advises/proposals are (but not limited to):

- (i) Level 0: removal from/no inclusion in the Priority List;
- (ii) Level 1: focused inspections;
- (iii) Level 2: EASA to address the operator (for TCO applicants only) or the relevant competent authority highlighting the ramp inspection results and request information on corrective actions implemented; and
- (iv) Level 3: further investigations/enforcement under Part-TCO or deferral to the European Commission for investigations under Regulation 2111/2005 (EU Safety List).

Between the 1<sup>st</sup> of January 2018 and the 31<sup>st</sup> of December 2019, four IDEA meetings have been held in Cologne. The distribution among the different level of advice issued by the expert panel following these meetings is presented in Table 2.

---

<sup>1</sup> ARO.RAMP.150

Table 2: Number of EASA advises issued after each IDEA meeting.

IDEA	Date	Level 0	Level 1	Level 2	Level 3
30	20/21 February 2018	10	106	8	0
31	29/30 September 2018	11	100	6	0
32	26/27 February 2019	21	103	9	0
33	10/11 September 2019	21	102	9	0

From the above numbers, it can be seen that the distribution amongst the different levels of advice is rather stable and not prone to drastic fluctuations. The majority of operators under the scope of the regular analysis received a Level 1 advice, ensuring its inclusion on the Priority List for ramp inspections.

The inspection results of operators with a high “SAFA ratio”<sup>2</sup> will only be analysed if stemming from at least 6 inspections (unless the SAFA ratio is exceptionally high). However, the subsequent “follow-up analysis” is done using the available reports. It should be noted that for the IDEA 33 (held in September 2019):

- 36 operators received a level 1 because they were not inspected since the previous analysis; and
- 19 operators analysed by IDEA experts were inspected less than 3 times during the period considered for the analysis. Generally, that is not enough information to change the level of advice.

### 3.4 Priority List

As part of the regulatory obligations originating from ARO.RAMP.105, EASA provides the competent authorities with a list of operators or aircraft identified as presenting a potential risk, for the prioritisation of ramp inspections. This Priority List is produced following every update of the Air Safety List and following the bi-annual regular analysis of ramp inspections, while minor updates are taking place monthly to incorporate recently authorised third country operators into the Chapter 5 of the list.

Between the 1<sup>st</sup> of January 2018 and the 31<sup>st</sup> of December 2019, Chapter 5 of the Priority List included operators granted with a TCO authorisation and which were:

- never inspected; or
- not inspected during the last 12 months.

The data in table 3 and figure 2 provides the number of operators which were included in Chapter 5 of the Priority List, for each month between January 2018 and December 2019.

<sup>2</sup> The “SAFA ratio” is a performance indicator reflecting the average number of (weighted) findings per ramp inspection.

Table 3: Number of operators in Chapter 5 of the Priority List per month

		2018	2019
No. of operators on Chapter 5 of the Priority List	Jan	94	188
	Feb	93	187
	Mar	92	183
	Apr	91	183
	May	189	194
	Jun	187	192
	Jul	187	193
	Aug	195	200
	Sep	185	209
	Oct	188	214
	Nov	187	209
	Dec	191	210

Figure 2: Evolution of the number of operators included in Chapter 5 of the Priority List

From May 2018 to December 2019 Chapter 5 of the Priority List contained a rather stable number of operators, around 200.

In the considered period of this report (i.e.: 2018-2019), operators which had not undergone any ramp inspections during the last 12 months were considered to be “new” operators and therefore included in Chapter 5 of the Priority List for ramp inspections. Notably, in May 2018, the list was significantly enlarged

to include operators with a TCO authorisation and not inspected during the last 12 months, which represents a large portion of all operators in Chapter 5 of the Priority List.

Besides the new operators from Chapter 5, the following operators were included in the Priority List between 2018 and 2019:

- operators identified during the regular analysis of ramp inspection data;  
Twice per year, a group of ramp inspection experts gathers to analyse the most relevant ramp inspection data and provides a level of advice for each of the discussed operators. One of the potential advices of the regular analysis is the inclusion of the operator on the priority list for ramp inspections. Operators with a level of advice equal to 1, 2 or 3, as issued by the IDEA experts, are included in the Priority List.
- operators and States identified during the analysis of other relevant information;  
This information can originate either from Part-TCO technical assessment or from the oversight of Part-145 organisation.
- operators listed on the Air Safety List (ASL);  
Operators listed on the Air Safety List or for whose State it is mentioned in the recitals that EASA Member States should verify the effective compliance with the relevant international safety standards through the prioritisation of ramp inspections, were also included on the Priority List. It should be noted that a State is only included in the recitals of the regulatory text updating the Air Safety List when that State is part of the agenda of the Air Safety List committee meeting.
- third-country operators for which the EASA TCO authorisation was reinstated following suspension or revocation;  
According to ARO.RAMP.105(b)(5), aircraft used by a third-country operator whose authorisation is limited or reinstated after suspension or revocation shall be included on the Priority List.
- third-country operators whose authorisation has either been refused to issue, suspended, or revoked;  
These operators are also included in the Priority List when such enforcement is based on safety grounds.
- States for which ICAO has issued a Significant Safety Concern;  
When ICAO has issued a Significant Safety Concern (SSC) to a State in a relevant domain, it is included on the Priority List.
- States and operators which are subject to active consultations under Regulation (EC) No 2111/2005;  
A State or operator which is subject to active consultations under Regulation (EC) No 2111/2005 was included in the Priority List for ramp inspections on an ad-hoc basis, as there was not such complete list available with all active consultations between 2018 and 2019.
- States considered unable to discharge their safety oversight responsibilities according to the ICAO USOAP;  
According to the outcome of ICAO USOAP reports, certain States are considered to be unable to discharge their safety oversight responsibilities and are placed on the Priority List as a consequence. It should be highlighted that the following limitations are in place with this approach:

- The year from which such data is available for all States differs greatly. In some cases, the data can even be considered outdated and no longer relevant for the actual situation in a State.
- It is challenging to define a “cut-off” value for the Level of Effective Implementation, after which confidence in a State is established.
- States considered by the FAA in Category 2.  
When a State was classified by the FAA as “Category 2”, it has been included in the Priority List. It should be emphasized that this information is not available for countries which are not providing air transport service to the US, which have no code-share arrangements with US carriers, or which have no significant interaction with the FAA.

### 3.5 RICS Meetings

Twice per year, EASA organises the Ramp Inspection Coordination and Standardisation (RICS) meeting. The spring meeting is organised in Cologne and the autumn meeting is hosted by one of the Participating States.

During the RICS meeting, EASA informs the Participating States on:

1. the on-going negotiations with States that may join the Programme;
2. IT developments of the ramp inspection tool;
3. the outcome of EASA standardisation activity;
4. data analysis results;
5. changes in the implementing rules (ARO.RAMP) affecting the programme; and
6. any other topic of interest for the RICS participants.

Participating States are also invited to contribute to the RICS with presentations on topics of interest for the Programme community.

The spring meeting is usually followed by the Industry Forum during which the regulators and industry have the opportunity to exchange on topics of common interest.

In April 2018, EASA organised the 7th RICS meeting hosted in Helsinki by TRAFICOM. 61 National Aviation Authority (NAA) delegates from 43 different Participating States, together with representatives of EUROCONTROL and the European Commission attended the meeting in Finland.

The RICS meeting planned in September 2018 was replaced by a workshop intended to support the work of the rulemaking task (RMT) group. This RMT aimed to remove most of the AMC & GM pertaining to ramp inspections and to transpose those into a Ramp Inspection Manual, to be published by EASA. The RMT also reviewed the individual AMC & GM provisions to modernise and clarify them. 67 participants among which NAA delegates from 39 different Participating States, representatives of EUROCONTROL, the European Commission participated in the workshop in Cologne, while the US Federal Aviation Administration (FAA) attended as observers.

On 26-28 March 2019, EASA hosted the 8th RICS meeting, which was attended by 65 National Aviation Authority representatives from 46 States. During the meeting, the results of the Ramp Simplification, System-Wide Coordination (SWC) and Manufacturer Data projects were presented and well-received. Two States attended as observers: Japan, which presented their ramp inspection programme as well as the upcoming ramp alcohol testing, and the US, which provided an update on their effort to join the Programme.

On 27 March 2019, more than 60 representatives from 10 additional States (not participating in the Programme), airline associations and ramp inspection training organisations joined the RICS participants for the 7th SAFA Regulators and Industry Forum. The attendees exchanged their experiences with the Programme, proposed presentations on its latest developments, and were informed on the roadmap for implementing alcohol testing during ramp inspections by August 2020 (edit: due to COVID-19 outbreak the roadmap has been extended until February 2021).

The 9th edition of the RICS meeting was held on 1-2 October 2019 in Berlin, hosted by the German Federal Aviation Office (LBA) in cooperation with the German Federal Ministry of Transport and Digital Infrastructure (BMVI).

The meeting was attended by 62 National Aviation Authority representatives from 42 Participating States and could also profit of the participation, as observers, of two representatives of the FAA. The meeting put a particular focus on the update of the Ramp Inspection Manual, including the draft guidance on the conduct of alcohol tests of crew members, which would become applicable in August 2020 (edit: due to COVID-19 outbreak the roadmap has been extended until February 2021). Further topics of common interest were discussed such as the results of the implementation of SWC and the evolution of RAMP standardisation. The meeting also included presentations on best practices by some authorities, offering valuable inputs for future updates of the Manual.

## 4 Regulatory Framework

The Programme is enforced in EASA Member States through the application of article 4 of the “COMMISSION REGULATION (EU) No 965/2012 of 5 October 2012 laying down technical requirements and administrative procedures related to air operations according to Regulation (EC) No 216/2008 of the European Parliament and the Council”, (the Air Operations Regulation).

The Programme implementation needs to comply with Subpart RAMP of Annex II of the Air Operations Regulation.

The 1<sup>st</sup> of September 2019, the Ramp Inspection Manual (RIM) compiles best practices and gives guidance to States performing ramp inspections; it covers the delivery, management and administration of ramp inspections as well as the ramp inspector qualification process. The core text of the RIM has the same status as Guidance Material within EASA regulatory framework. Being referenced by an AMC, the appendixes of the RIM have the same status as AMCs within EASA regulatory framework. The appendixes of the RIM consist of:

- Inspection Instructions and PDFs, containing the ramp inspection instructions and the list of pre-described findings;
- the Training Syllabi, regarding Ramp Inspectors qualification; and
- the standard form of the Proof of Inspection.

Whereas this legal framework does not apply to non-EASA States, such States committed to implement them through the signature of WA with EASA.

### 4.1 Changes published in 2018

In 2018, the regulatory framework applicable to the Programme was modified as follows.

#### 4.1.1 Commission Regulation (EU) 2018/1042 & ED Decision 2018/012/R (Alcohol testing)

The Regulation 965/2012 (The “Air Operations Regulation”) was amended by:

- CR (EU) 2018/1042 of 23 July 2018, as regards technical requirements and administrative procedures related to introducing support programmes, psychological assessment of flight crew, as well as systematic and random testing of psychoactive substances to ensure medical fitness of flight and cabin crew members, and as regards equipping newly manufactured turbine-powered aeroplanes with a maximum certified take-off mass of 5700 kg or less and approved to carry six to nine passengers with a terrain awareness warning system.

The applicable AMC and GM to Subpart RAMP of Annex II were modified by:

- ED Decision 2018/012/R of 21 November 2018, that:
  - inserted AMC1, GM1, GM2 and GM3 ARO.RAMP.106 on alcohol testing;
  - amended AMC4 ARO.RAMP.115(b)(2) on the check-list for the qualification of ramp inspectors; and
  - amended AMC2 ARO.RAMP.125 on the Proof of Inspection checklist.

These changes introduced the requirement for EASA Member States to ensure as of the 14<sup>th</sup> of August 2020 (edit: entry into force delayed to the 14<sup>th</sup> of February, 2021 due to the COVID-19 outbreak) that alcohol testing of the flight crew and cabin crew members is carried out with regard to operators under their own oversight as well as with regard to operators under the oversight of another Member State or a third country. Such testing shall be performed by ramp inspectors within the framework of the EU Ramp Inspection Programme of Subpart RAMP of Annex II or by way of derogation by other authorised officials and outside the framework of Subpart RAMP of Annex II, provided that such alcohol testing meets the same objectives and adheres to the same principles as tests carried out under the framework of Subpart RAMP of Annex II.

These changes were consequences of the output delivered by the EASA-led Task Force established following the 4U 9525 flight accident.

## 4.2 Changes published in 2019

In 2019, the regulatory framework applicable to the Programme was modified as follows.

#### 4.2.1 Commission Implementing Regulation (EU) 2019/1384

The Regulation 965/2012 was amended by:

- COMMISSION IMPLEMENTING REGULATION (EU) 2019/1384 of 24 July 2019 amending Regulations (EU) No 965/2012 and (EU) No 1321/2014 as regards the use of aircraft listed on an air operator certificate for non-commercial operations and specialised operations, the establishment of operational requirements for the conduct of maintenance check flights, the establishment of rules on non-commercial operations with reduced cabin crew on board and introducing editorial updates concerning air operations requirements

These minor changes clarified:

- criteria to establish the Priority List defined by ARO.RAMP.105;
- criteria to maintain the validity of ramp inspector qualification;
- criteria to lift an aircraft grounded in application of ARO.RAMP.140; and
- Agency coordination tasks.

#### 4.2.2 ED Decision 2019/007/R

The applicable AMCs and GMs to Annex II, Subpart RAMP were modified by:

- ED Decision 2019/007/R of 27 February 2019, whose major changes were:
  - insertion of GM1 ARO.RAMP.005 on the Ramp Inspection Manual;
  - amendment of AMC1 ARO.RAMP.100(c) on annual ramp inspection programme (System-Wide Coordination - SWC);
  - amended of AMC1 ARO.RAMP.125 on the conduct of ramp inspections and ARO.RAMP.130 on the categorisation of findings and use of new proof of inspection;
  - insertion of AMC1 ARO.RAMP.145 on important safety information; and
  - insertion of AMC1 ARO.RAMP.150 on SWC of ramp inspections.

This decision introduced the **Ramp Inspection Manual (RIM)** and the **System-Wide Coordination (SWC) process**.

##### 4.2.2.1 Ramp Inspection Manual (RIM)

The Ramp Inspection Manual production was initiated in 2017. EASA established two working groups in parallel, one to create the core text of the Ramp Inspection Manual and another one to review the Inspection Instructions and the pre-described findings (PDFs).

The first edition of the EASA RIM was published on 20 March 2019 with applicability on 1 September 2019.

The RIM provides a flexible legal framework to achieve these objectives. Indeed:

- amendments to the core part of the RIM and its attachments will be notified to all the RICS members before their publication. Depending on the urgency of the change, this notification will take place either via email or during RICS meetings. The RICS members will have in both cases the possibility to provide comments on the proposed amendments;
- amendments to appendices to the Ramp Inspection Manual will be subject to a focussed consultation of the OPS.TeB/FS.TEC Members, allowing them to provide comments on the draft amendments before the final version is adopted. EASA will then review the comments and prepare the final version for publication. In case of a major disagreement on a substantial change, the proposed amendment will be discussed at the next OPS.TeB meeting; and
- outside these two levels of consultation, the EASA Member States and the non-EASA Participating States may provide comments on the current version of the Manual by submitting them to [safo@easa.europa.eu](mailto:safa@easa.europa.eu)

#### 4.2.2.2 System Wide Coordination (SWC)

The System Wide Coordination (SWC) aims to further coordinate the number of inspections performed annually on operators and prevent under and over inspection of operators with an important traffic in several EASA Member States. The development of this system started in 2017 and was tested by volunteer States in 2018 and 2019. SWC entered into force the 1<sup>st</sup> of January 2020.

Within the framework of SWC EASA is in charge to set and distribute among the EASA Member States a yearly target of inspections for operators qualified as “Layer 1” operators. “Layer 1” operators are operators verifying a minimum traffic criteria based on the number of landings performed in the EASA Member States. Operators not qualified as “Layer 1” are “Layer 2” operators. The yearly target of inspection assigned to “Layer 1” operators is set according to a risk-based matrix that takes into account the operator traffic and its confidence level assigned by EASA. The confidence level calculation takes notably into consideration:

- the ramp inspection results;
- the Air Safety List;
- the ICAO USOAP results of the State of Operator;
- the number of accident involving operator aircraft;
- the age of the fleet;
- the operator aircraft type(s); and
- IOSA operator results if available.

EASA Member States shall define their annual ramp inspection programme on “Layer 1” operators, based on the target numbers of inspections assigned by EASA. The “Layer 1” targets are updated once a year during the mid-year update. This update takes into account updated traffic data and confidence levels. Within SWC, States can trade between themselves targets of inspection to be performed on a given operator.

2018 and 2019 were test years for SWC. In 2018 21 EASA Member States participated in the SWC trial phase and in 2019 all EASA Member States participated in the trial.

After the first year of test, the general feedback from the States was:

- programming was easier but planning was more difficult;
- inspectors needed to get used to restrictive targets;
- States needed the flexibility to cater for:
  - o national specifics;
  - o immediate safety concerns (e.g. Emergency ADs); and
  - o unforeseen changes in operators/number of flights
- inspection « trading » increased flexibility but was deemed cumbersome.

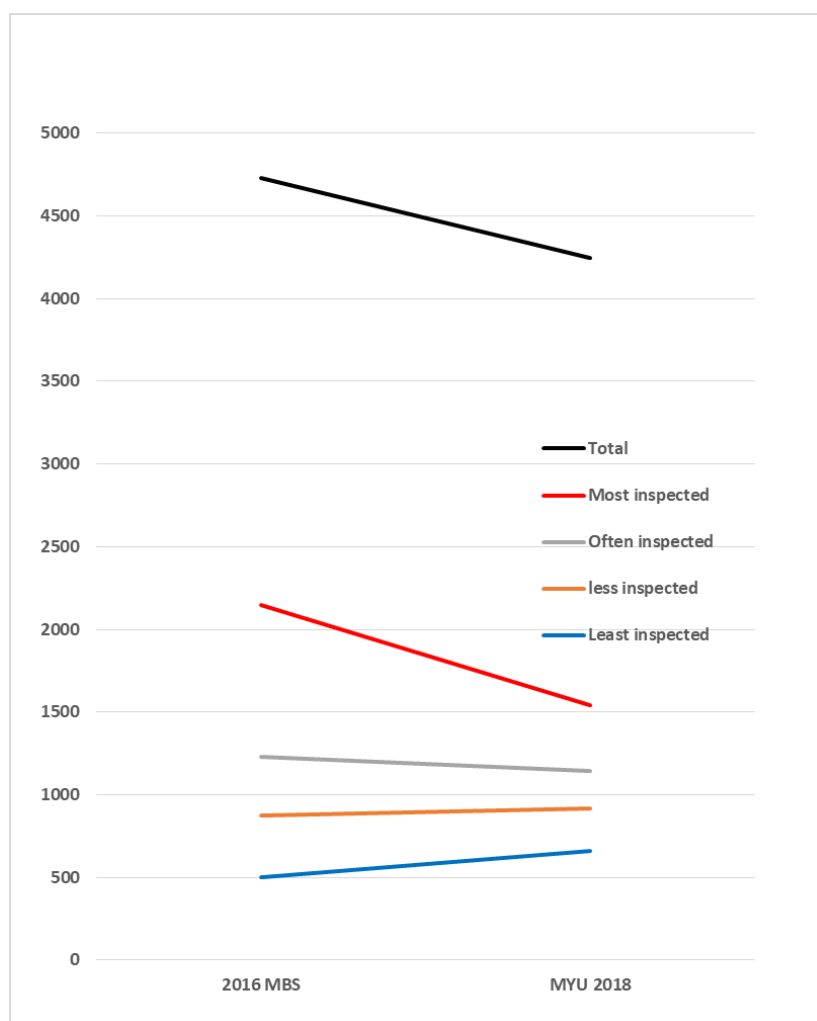

At the end of 2018, EASA assessed the impact of SWC. To do so EASA divided operators into 4 groups defined according to the number of inspections performed in 2016 per operator:

- « Most inspected » (148-57 inspections);
- « Often inspected » (57-40 inspections);
- « Less inspected » (39-24 inspections); and
- « Least inspected » (24-5 inspections).

The data in figure 3 indicates for the two most inspected groups, that the number of inspections went down, whereas the least inspected group was more often inspected.

Figure 3: Impact on the core group of Layer 1 Operators in number of inspections compared to the target

The EASA conclusions of this first year of test were:

- SWC did address both:
  - o over-inspection for most inspected operators, and
  - o Under-inspection for less and least inspected operators
- positive effects of SWC were partially undone by non-EASA States;
- more flexibility was required; and
- inspection trading needed better IT support.

In 2019, EASA improved the ramp inspection tool to support SWC implementation (see chapter 5.2) and States built on their 2018 experience. As a result, only 3.5% deviation from the 2019 assigned targets was noticed at the end of 2019. This deviation was due to:

- 73 inspections performed over the assigned target on 28 different Layer 1 operators, not on the Priority List (target on operators on the Priority List can be over performed within SWC, such over performance is not counted as a deviation);
- 138 inspections not performed on 43 different Layer 1 operators (for these operators the SWC assigned targets were not achieved).

In 2019, 242 inspections were traded between the States.

#### 4.2.2.3 Inspection Instructions (INST.RI.01/003)

The Inspection Instructions document was amended and published as No INST.RI.01/003 on 20 March 2019 and applicable on 1 September 2019. A corrigendum was issued on 26 April 2019 maintaining the same applicability date. The amendment covered the following subjects.

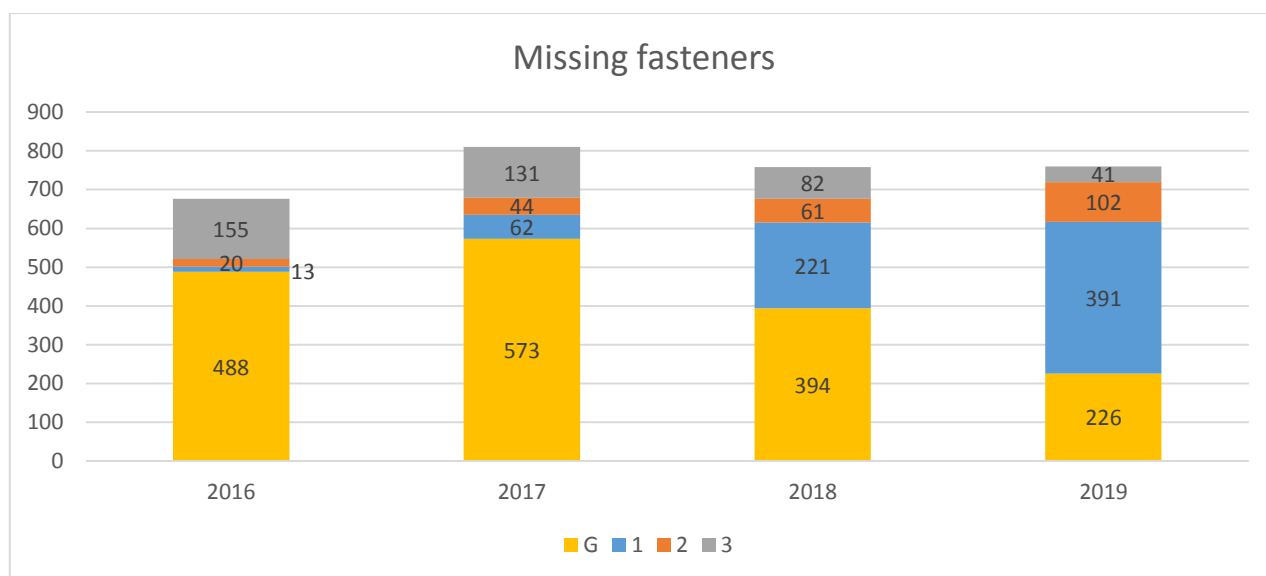

##### 4.2.2.3.1 Manufacturer data

This amendment introduced a revised methodology to categorise findings related to missing fasteners and broken bonding wires developed within the “manufacturer data project”. This revised methodology introduced an assessment matrix providing guidance to the inspector on potential non-compliances and their associated categories. The previous procedure to categorise technical defects is still applicable to other technical defects.

In 2018, 7 States volunteered to participate in the trial of manufacturer data project. The project was fully implemented in the ramp inspections procedures in 2019 and applicable as of the 1<sup>st</sup> of September 2019.

The number of findings raised on missing fasteners is presented in figure 4. The analysis on bonding wire is not done as its impact on the Programme is less significant.

Figure 4: Findings raised on missing fasteners

Following the manufacturer data project implementation, the number of findings related to missing fasteners remained constant, but the average categorisation was significantly changed as follows:

- the number of CATG remarks and CAT3 findings was reduced significantly;
- the number of CAT1 findings increased significantly; and
- the number of CAT2 findings increased.

Despite the limited number of States engaged in the trial, the impact of “Manufacturer data project” was already noticeable in 2018. In 2019 more States applied the new process voluntarily ahead of the application date, explaining the increasing difference.

#### 4.2.2.3.2 Major changes

The categories of the following PDFs were changed as of the 1<sup>st</sup> of September 2019.

1. Galley or trolley (when used) waste receptacle access door covers inoperative are now raised as significant instead of major findings.
2. Missing or unreadable marking are raised as significant when they are related to ground servicing.

Due to the proximity of cabin crew members, a galley or trolley (when used) waste receptacle access door cover inoperative was deemed to have a lower impact on safety than a lavatory waste receptacle access door cover inoperative. The PDF CAT2 "Galley or trolley (when used) waste receptacle access door cover inoperative" was introduced to reflect this difference on safety impact.

Due to the number of findings raised on marking and placard missing or unreadable, EASA worked to standardise the way these findings are raised and simplified the wording of the findings. The new wording of the PDF is in line with Annex 8 requirements and is easily understandable by every ramp inspector and operator.

Table 4: Effect of PDF changes

Pre-described finding	2018				2019			
	G	1	2	3	G	1	2	3
Galley or trolley (when used) waste receptacle access door cover inoperative							34	
Galley/lavatory waste receptacle access door cover inoperative (outside dispatch limits/conditions)				92				44
Lavatory waste receptacle access door cover inoperative								1
<b>Grand Total</b>				<b>92</b>			<b>34</b>	<b>45</b>

Pre-described finding	2018				2019			
	G	1	2	3	G	1	2	3
Markings and/or placards required by the manufacturer not applied or unreadable		460				309		
Safety markings not applied or unreadable			246				138	
Markings and/or placards not related to ground servicing required by the manufacturer not applied or unreadable						130		
Ground servicing placards and markings not applied or unreadable							73	
<b>Grand Total</b>		<b>460</b>	<b>246</b>			<b>439</b>	<b>211</b>	

Other PDFs were changed but with a lesser impact on the inspection results.

#### 4.2.2.4 Train the trainer

In accordance with AMC1 ARO.RAMP.115(b)(3) "whenever deemed necessary by the Agency, e.g. after major changes in the inspection procedures", ramp inspectors need to undergo recurrent training.

Following the publication of the ED Decision 2019/007/R in February and the implementation of the "System-Wide Coordination" and "Use of Manufacturer data" projects, the Agency has scheduled three recurrent training workshop sessions, addressed to qualified inspectors and representatives of the Ramp Inspection Training Organisations.

The workshops were scheduled as follows:

- 28/29 April 2019;
- 14/15 May 2019; and
- 28/29 May 2019.

In total EASA delivered 90 certificates of attendance for these 3 workshops.

Note: following the publication of the ED Decision 2019/007/R this AMC doesn't longer exist. Under the current regulatory framework, the equivalent requirement can be found in AMC7 ARO.RAMP.115(a)(b) §(b).

## 4.3 On-going developments

### 4.3.1 Alcohol testing procedures

As discussed during the RICS-8 meeting in March 2019, EASA established a working group to develop further guidance to the implementation of the requirements deriving from ARO.RAMP.106 on alcohol testing. The guidance will be incorporated in the RIM.

Among the main purposes of such guidance, they were to provide information on:

- how to apply the risk-based approach to alcohol testing;
- how to perform an alcohol test;
- how to report alcohol testing results;
- how to follow-up on positive test;
- training requirements for ramp inspectors; and
- other technicalities.

A consultation on the draft guidance and procedures delivered by the working group was initiated in December 2019 and ended in January 2020.

The activity of the working group is expected to be completed in 2020.

### 4.3.2 PDF Working Group(s)

After RICS-8 a permanent working group (PDF-WG) was installed. The members of the PDF-WG were initially the same as the working group which worked on the pre-described findings in the scope of the Ramp Inspection Manual project. The PDF-WG members are selected among various EASA and non-EASA Participating States experts. A rotating schedule for seats in this working group ensures harmonisation between States.

The Terms of References aimed at meeting at least monthly through videoconference to discuss new proposals coming from the Participating States or EASA. The PDF-WG has met 8 times in 2019.

The work of the PDF-WG has resulted in various changes to the PDF list, multiple changes to the inspection instructions and an amendment of several chapters in the RIM. These changes were delivered at the end of 2019. Therefore changes introduced by the PDF-WG had no or minimal impact on the 2019 inspection results.

## 5 Population inspected

### 5.1 Overview

The Programme ensures an active oversight of aircraft landing in all the Participating States (the EASA Member States and the non-EASA Participating States). The information provided by ramp inspection reports support the decision-making process of stakeholders (e.g.: the risk-based oversight performed by EASA within the framework of TCO activity, before approving a wet lease-in agreement the EASA Member State competent authority of the lessee should assess available reports on ramp inspections performed on aircraft of the lessor...). Therefore, it is important that ramp inspections are performed on the widest possible range of operators and aircrafts landing in the Participating States and ensure a satisfactory coverage of traffic coming in the EASA Member States.

Table 5: General overview of the Programme

	2013	2014	2015	2016	2017	2018	2019
States of inspections	40	43	44	46	46	47	47
Inspections performed	11 679	11 630	12 040	12 475	13 156	12 232	11 657
Aerodromes of inspection	345	358	354	364	359	361	375
No. of tail number inspected	6 554	6 554	6 791	7 218	7 594	7 372	7 177
Operators inspected	1 074	1 087	1 166	1 255	1 321	1 406	1 376
Average no. of inspection per operator inspected	10.9	10.7	10.3	9.9	10.0	8.7	8.5
State of Operator inspected	142	138	142	147	148	145	143
Aircraft types inspected	209	218	227	230	242	250	230

At the end of 2018, the number of Participating States which performed inspections raised from 46 to 47 after Australia became a Participating State of the Programme.

After a peak in 2017, the total number of inspections progressively decreased both in 2018 and 2019. In 2019 compared to 2018, the number of inspections decreased by 575. This decrease is in one hand explained by the results of the SWC test phase and on the other hand by the ramp inspections performed in the non-EASA Participating States. The EASA Member States performed 407 inspections less in 2019 than in 2018 and the non-EASA Participating States performed 168 inspections less in 2019 than in 2018.

Table 6: Planned number of inspection and performed number of inspections by EASA Member States

Planned number of inspections	2018	2019	Variation 18-19 #	Variation 18-19 %
Achieved number of inspections	7 497	7 252	-245	-3.3%
EASA Member States	10 216	9 809	-407	-4.0%

In 2018 Layer 1 targets amounted to 5 577 inspections and Layer 2 targets to 1 920 inspections (these numbers are a simulation of the application of SWC on all EASA Member States); In 2019, Layer 1 targets

totalised 5 412 inspections and Layer 2 targets 1 840 inspections. According to the annual programme of the EASA Member States and SWC test phase, a decrease of 245 inspections was anticipated in 2019 in comparison to 2018.

The decrease of the planned number of inspections in the EASA Member States in 2019 can be explained by:

1. the number of operators qualified as Layer 1 within the SWC framework
  - during 2019 mid-year update of SWC, 177 operators qualified as Layer 1 this number was 194 after the 2018 mid-year update.
2. the level of confidence assigned to Layer 1 operators within the SWC framework
  - for 55 Layer 1 operators the confidence level improved in 2019 compared to 2018 resulting in a decrease of inspection targets in 2019 by comparison with 2018 Layer 1 target.
  - for 42 Layer 1 operators the confidence level worsened in 2019 compared to 2018 resulting in an increase of inspection targets in 2019 by comparison with 2018 Layer 1 target.

The average level of traffic of Layer 1 operator within the SWC framework didn't change significantly between 2018 and 2019.

This decrease in the planned number of inspections was amplified by unexpected events that happened in 2019. In 2019, 4 large airlines bankrupted WOW air, Jet Airways, Germania and British Midland Regional. These bankruptcies resulted in a drop-down by 94 in the number of inspections performed in 2019 in comparison with 2018. The suspension of the TCO authorisation for one Layer 1 operator in 2019 explained an additional loss of 19 inspections performed in comparison with 2018.

In total, EASA Member States over-performed the minimum number of inspections planned within the SWC framework by providing additional inspections on Layer 2 operators mainly.

*Table 7: Planned number of inspection and performed number of inspections by non-EASA Participating States*

Planned number of inspections	2018	2019	Variation 18-19 #	Variation 18-19 %
Achieved number of inspections				
Non-EASA Participating States	2 315 2 016	2 271 1 848	-44 -168	-1.9% -8.3%

Considering the non-EASA Participating States, we can notice that the established annual programmes were not fully achieved in 2018 and 2019. This may be caused by unanticipated events happening during the year and un-controlled by States, and it can't be analysed within this report as a thorough analysis of the root cause should be done. However, information collected from EASA standardisation activities pointed out that some non-EASA Participating States may have anticipated in 2019 the update of the calculation methodology for the number of inspections introduced in the RIM. The new calculation methodology should be endorsed by an update of working arrangements. This new methodology will decrease the number of inspections to be included in the annual programme for the Participating States not part of SWC. This will be more detailed in the 2020 annual report.

In 2018 and 2019, respectively 126 and 136 operators were inspected only by the non-EASA Participating States representing respectively 9.0% and 9.9% of operators inspected within the Programme.

In 2019, the number of airports where ramp inspections were performed increased in comparison with 2018.

Despite the reduction of the number of inspections to a value close to 2014, the number of operators inspected in 2019 is significantly higher than in 2014. The number of inspected operators stayed stable between 2018 and 2019.

As an average, the number of inspections per inspected operator in 2019 decreased by about 15% compared to 2017.

The number of inspections per tail number followed a similar evolution.

## 5.2 Inspections on aircraft operated by operators included in the Priority List

The percentage of inspections performed on aircraft, used by operators which are on the Priority List, is the same for 2018 and 2019. It is in line with the stable population of prioritised operators during this period.

*Table 8: Proportion of inspections performed on operators included in the Priority List.*

Number of inspections performed	2018	2019
Total	12 232	11 657
Not in Priority List	10 037	9 567
%	82.1%	82.1%
In Priority List	2 195	2 090
%	17.9%	17.9%

The number of inspected tail numbers shows a slight decrease in 2019 and concerns mostly non-prioritised tail number.

*Table 9: Inspection on "tail number" used by operators included in the Priority List*

Number of tail number inspected	2018	2019
No. of non-prioritised tail number inspected	6 317	6 153
% of non-prioritized tail number inspected	85.0%	84.9%
No. of inspection per non-prioritised tail number	1.59	1.55
No. of prioritised tail number inspected	1 111	1 094
% of prioritized tail number inspected	15.0%	15.1%
No. of inspection per prioritised tail number	1.98	1.91

The number of inspections per tail number was higher for those on the Priority List both in 2018 and 2019.

### 5.3 Aircraft configuration

In 2018 and 2019, only 16 and 13 inspections were performed on aircraft configured for the combined transport of passengers and cargo. These numbers are considered too low for analysis and therefore this chapter focusses on cargo and passenger aircraft only.

Table 10: Activity per aircraft configuration

Aircraft configuration	Cargo		Passenger	
Year of inspection	2018	2019	2018	2019
Number of inspections	949	981	11 267	10 663
State of inspection	44	45	47	47
Number of tail number inspected	572	583	6 867	6 635
Number of inspections per tail number inspected	1.7	1.7	1.6	1.6
Number of operators inspected	145	126	1 350	1 315
Number of inspections per operator inspected	6.5	7.8	8.3	8.1

In 2019 the average number of inspections per operator increased for cargo aircraft and lightly decrease for passenger aircraft in comparison with 2018. The average number of inspections per operator for both configurations were comparable in 2019 while it was significantly lower for cargo aircraft than for passenger aircraft in 2018.

In 2018, 75 tail numbers were subject to 233 ramp inspections, but reports associated identified them in the database with different configurations (passenger or cargo). In 2019, 49 tail numbers inspected 143 times were in that situation.

### 5.4 Type of operation

Following the risk-based approach, ramp inspections are mostly performed on Commercial Aviation.

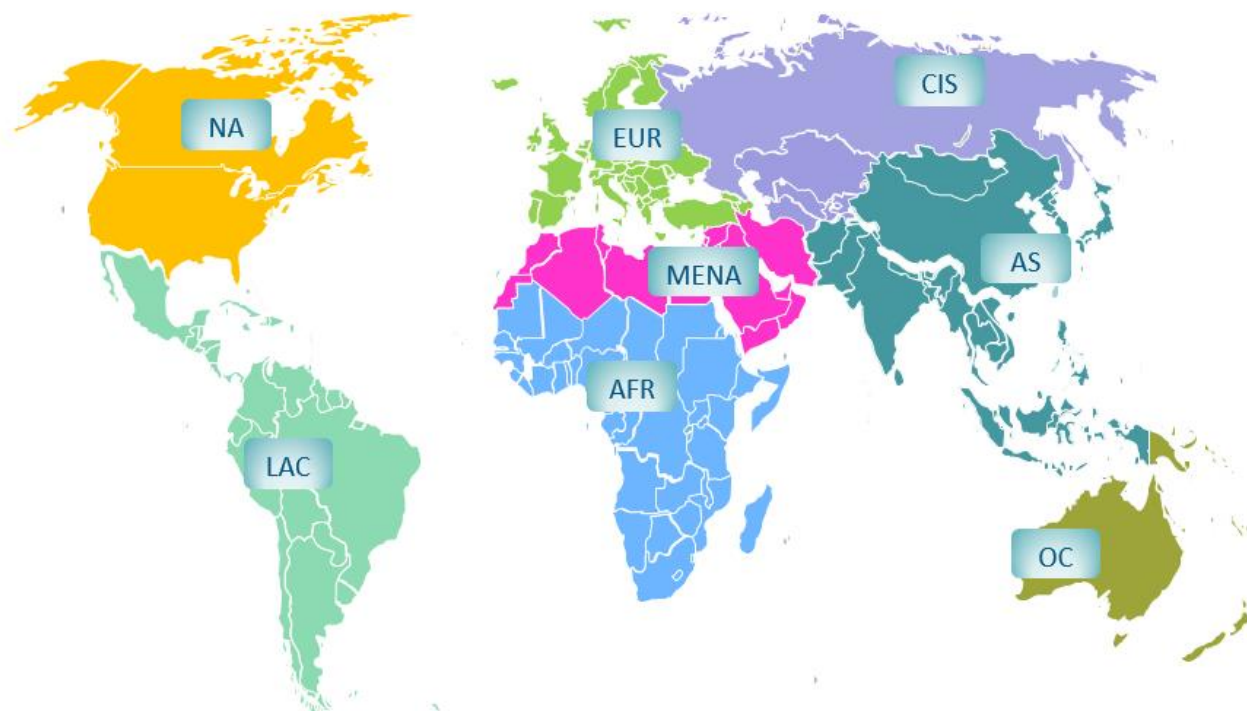

Table 11: Activity per type of operation

type of operation	Commercial Aviation		General Aviation	
Year of inspection	2018	2019	2018	2019
Number of inspections	11 430	10 962	802	695
States of inspections	47	47	37	34
Number of inspected tail number	6 726	6 608	706	629
Number of inspections per inspected tail number	1.7	1.7	1.1	1.1

As the number of operators in General Aviation can hardly be defined, we can only compare the number of inspections per tail number inspected. For 2018 and 2019, this number is stable for both types of operations. Tail numbers operated in General Aviation were significantly less inspected than tail numbers operated in Commercial Aviation.

## 5.5 World coverage

*Figure 5: World regions definition*

**EASA Member States** - Austria, Belgium, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Norway, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Switzerland, United Kingdom.

**Europe (ECAC)** - Albania, Armenia, Austria, Azerbaijan, Belgium, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Georgia, Germany, Greece, Hungary, Iceland, Ireland, Italy, Latvia, Lithuania, Luxembourg, North-Macedonia, Malta, Republic of Moldova, Monaco, Montenegro, Netherlands, Norway, Poland, Portugal, Romania, San Marino, Serbia, Slovakia, Slovenia, Spain, Sweden, Switzerland, Turkey, Ukraine, United Kingdom.

**Russian Federation, Belarus and Central Asia** - Belarus, Kazakhstan, Kyrgyzstan, Russian Federation, Tajikistan, Turkmenistan, Uzbekistan.

**North America** - Canada, United States of America.

**Latin America & the Caribbean** – Anguilla, Antigua and Barbuda, Argentina, Aruba, Bahamas, Barbados, Belize, Bermuda, Bolivia, Brazil, Cayman Islands, Chile, Colombia, Costa Rica, Cuba, Curacao, Dominica, Dominican Republic, Ecuador, El Salvador, Grenada, Guatemala, Guyana, Haiti, Honduras, Jamaica, Mexico, Nicaragua, Panama, Paraguay, Peru, Saint Kitts and Nevis, Saint Lucia, Saint Vincent and the Grenadines, Suriname, Trinidad and Tobago, Turks and Caicos Islands, Uruguay, Venezuela (Bolivarian Republic of).

**Middle East and North Africa (MENA)** - Algeria, Bahrain, Egypt, Iran (Islamic Republic of), Iraq, Israel, Jordan, Kuwait, Lebanon, Libya, Morocco, Oman, Qatar, Saudi Arabia, Syrian Arab Republic, Tunisia, United Arab Emirates, Yemen.

**Africa (AFR)** - Angola, Benin, Botswana, Burkina Faso, Burundi, Cameroon, Cape Verde, Central African Republic, Chad, Comoros, Congo, Cote d'Ivoire, Democratic Republic of the Congo, Djibouti, Equatorial Guinea, Eritrea, Ethiopia, Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Kenya, Lesotho, Liberia, Madagascar, Malawi, Mali, Mauritania, Mauritius, Mozambique, Namibia, Niger, Nigeria, Rwanda, Sao Tome and Principe, Senegal, Seychelles, Sierra Leone, Somalia, South Africa, Sudan, Eswatini, Tanzania (United Republic of), Togo, Uganda, Zambia, Zimbabwe.

**Asia (AS)** - Afghanistan, Bangladesh, Bhutan, Brunei Darussalam, Cambodia, China, Democratic People's Republic of Korea, Hong Kong (Special Administrative Region of China), India, Indonesia, Japan, Lao People's Democratic Republic, Malaysia, Maldives, Mongolia, Myanmar, Nepal, Pakistan, Philippines, Republic of Korea, Singapore, Sri Lanka, Taiwan, Thailand, Timor-Leste, Vietnam.

**Oceania (OC)** - Australia, Fiji, Kiribati, Marshall Islands, Micronesia (Federated States of), Nauru, New Zealand, Palau, Papua New Guinea, Samoa, Solomon Islands, Tonga, Tuvalu, Vanuatu

Table 12: Regional indicators

Region	2018				2019			
	No. of States inspected	No. of Operators inspected	Inspect. (I)	No. of States of Inspection	No. of States inspected	No. of Operators inspected	Inspect. (I)	No. of States of Inspection
EASA States (EU+3)	31	642	6 686	46	31	625	6 429	47
EUROPE (ECAC)	44	786	7 862	47	44	765	7 456	47
Russian Federation, Belarus & Central	7	61	698	41	7	65	623	41
North America	3	198	919	35	3	208	834	35
Latin America & the Caribbean	26	94	283	16	26	85	285	19
Middle East and North Africa	17	107	1 250	43	17	100	1 184	42
Africa	18	30	226	26	16	32	221	26
Asia	22	111	947	37	23	107	984	31
Oceania	8	19	47	7	7	21	70	6

47 Participating States performed ramp inspections on operators from the EASA (EU +3) region and EUROPE (ECAC) region and a large number of operators from these regions have been inspected.

On the other side, the Participating States inspected a limited number of operators from Oceania and Africa. Only 6 Participating States provided inspection reports on Oceania operators, this region is one of the least inspected among all. Oceania operators are mainly inspected by Australia, Singapore, United-Kingdom and France (in New Caledonia).

It should be noticed that Spain, United-Kingdom, The Netherlands and France (in overseas territories and dependencies) provided the majority of inspections performed on operators from Latin America and the Caribbean.

## 5.6 Traffic coverage

The analysis will focus on aircraft with Maximum Take-Off Weight (MTOW) over 5,700 Kg operating into, within or out of the EASA Member States. The traffic data stems from EUROCONTROL; for that reason, Iceland is excluded from the analysis as it is not covered by EUROCONTROL. The traffic is the number of landings and excludes the number of landings made by operators in their State.

Table 13: Traffic coverage<sup>3</sup>

Operator data	2018		2019	
	EASA operator	TCO	EASA operator	TCO
<b>Total No. of landings</b>	4 467 800		4 519 498	
<b>No. of landings</b>	3 734 149	733 651	3 762 491	757 007
<i>% on total No. of landings</i>	83.6%	16.4%	83.3%	16.7%
<b>No. of operators which landed in EASA Member States<sup>2</sup></b>	1 062	1 910	1 029	1 880
<i>% of operators</i>	35.7%	64.3%	35.4%	64.6%
<b>No. of inspections</b>	5 482	4 080	5 428	3 854
<i>% on total No. of inspections</i>	57.3%	42.7%	58.5%	41.5%
<b>No. of inspected operators</b>	523	604	512	584
<i>% of inspected operators</i>	46.4%	53.6%	46.7%	53.3%
<b>No. of landings generated by all inspected operators</b>	4 342 775		4 394 252	
<b>No. of inspected tail number</b>	3 272	2 611	3 262	2 470
<i>% of inspected tail number</i>	55.6%	44.4%	56.9%	43.1%
<b>No. of inspection per inspected operator</b>	10.5	6.8	10.6	6.6
<b>No. of inspection per inspected tail number</b>	1.7	1.6	1.7	1.6
<b>No. of inspection per landing</b>	0.15%	0.56%	0.14%	0.51%

Operators which were inspected in 2018 and 2019, together covered more than 90% of the European traffic in 2018 and 2019.

There is a significant number of operators landing on an occasional basis only within EASA MS. Therefore, despite the good traffic coverage, only about 37% of operators<sup>4</sup> landing in EASA Member States (excluding Iceland) are inspected each year.

<sup>3</sup> All traffic data comes from TCO utility tool provided by EUROCONTROL and is manually filtered to exclude traffic from aircraft with a MTOW<5.7T

<sup>4</sup> Using Eurocontrol data and counting the number of operator names for aircraft with MTOW >5,7T

Table 14: Number of operators per category of traffic

Number of landings	Number of operators in 2018	Number of inspected operators in 2018*	Number of operators in 2019	Number of inspected operators in 2019*
More than 10 000	83	80	83	80
More than 5 000 less than 10 000	43	43	45	43
More than 1 000 less than 5 000	167	163	153	151
More than 500 less than 1 000	107	100	103	97
More than 100 less than 500	369	276	348	236
More than 50 less than 100	234	91	233	91
Less than 50	1 974	231	1 944	125

\*These statistics require a matching between the taxonomies used by Eurocontrol and EASA. This is particularly difficult for General Aviation as no AOC is specifying the operator details. For 2019, 273 inspected operators using aircraft with a MTOW>5.7T couldn't be matched; in 2018, this number was 143. This issue significantly impacts the statistics for the "less than 50 landings" category.

The proportion of inspection performed on TCOs and EASA operators stayed stable in 2019 compared to 2018.

The percentage of the EASA operators' flights subjected to ramp inspections against the total number of EASA operators' flights in EASA Member States (excluding Iceland) went from 0.15% in 2018 to 0.14% in 2019, while for TCOs flights it moved from 0.56% to 0.51% respectively.

## 6 Standardisation

Given the collective nature of the Programme, it is important that all inspections are performed in a standardised manner within all the Participating States. Standardisation in the performance of ramp inspections is essential for several reasons, like to have a uniform playing field avoiding any type of discrimination or partiality by making use of common methodology and assessment criteria to be applied to all air operators, to gather consistent and reliable data to be used for the safety assessment of operators' performance, statistical analysis, etc.

### 6.1 EASA Standardisation activities

One of the main standardisation activities is the standardisation inspection. The standardisation inspections are carried out according to the working methods established in Commission Implementing Regulation (EC) No 628/2013 of 28 June 2013. They incorporate database analysis and on-site visits including the

observation of ramp inspections performed by the qualified personnel of the inspected competent authority.

In 2018, 12 Participating States have been subject to standardisation inspections. 7 inspections were conducted as stand-alone comprehensive inspections on non-EASA Participating States, while the other 5 were performed as focused inspection, within a wider OPS standardisation framework, on EASA Member States.

In 2018, more emphasis has been put on continuous monitoring by a consistent use of the results of the periodic detailed analysis of the information entered into the centralised database. This resulted in proactive actions and measures taken by EASA concerning the Participating States.

In 2019, 8 Participating States have been subject to standardisation inspections. 5 of the inspections were conducted as stand-alone comprehensive inspections on non-EASA Participating States, while the other 3 were performed as focused inspection, within the OPS standardisation framework, on EASA Member States.

The focus on continuous monitoring continued also in 2019. When necessary, EASA established communication with the affected Participated States, requesting clarifications or corrective actions.

## 6.2 Continuous monitoring

Within its standardisation activities, EASA uses indicators calculated at the State level. These indicators are used to identify potential non-standard implementation of the Programme by State. Here after are presented two of these indicators aggregated at the Programme level.

### 6.2.1 Use of PDF

A high proportion of non-compliance categorised according a PDF ensures the same categorisation of a similar non-compliance independently of the State of Inspection.

In 2018 and 2019, PDF represented respectively 81.4% and 82.2% of the number of findings raised.

It should be noted that the list of PDFs is available only for Commercial Aviation so that all findings raised on General Aviation were not covered by a PDF and therefore raised as a User Defined Finding (UDF). The findings raised on General Aviation represented respectively 7.0% and 5.5% of all the findings raised in 2018 and 2019.

EASA appointed the PDF-WG to develop the list of PDF for General Aviation to improve the standardisation of findings raised.

### 6.2.2 Checklist coverage

Another indicator is the average number of items checked during a ramp inspection. As each inspection is considered in the same way for calculations of indicators used within EASA coordination tasks, a good coverage of the checklist is needed to ensure reliability of these indicators.

### 6.2.2.1 Overview

Table 15: Overview on findings and inspected items

	Year						
	2013	2014	2015	2016	2017	2018	2019
Total Inspections (I)	11679	11630	12040	12475	13156	12232	11 657
Total Inspected Items (II)	467408	476833	499186	525239	558653	525181	504 486
Average no. of inspected items during an inspection	40.0	41.0	41.5	42.1	42.5	42.9	43.3

It should be noticed that the average number of inspected items during an inspection showed a slight constant increase since 2013.

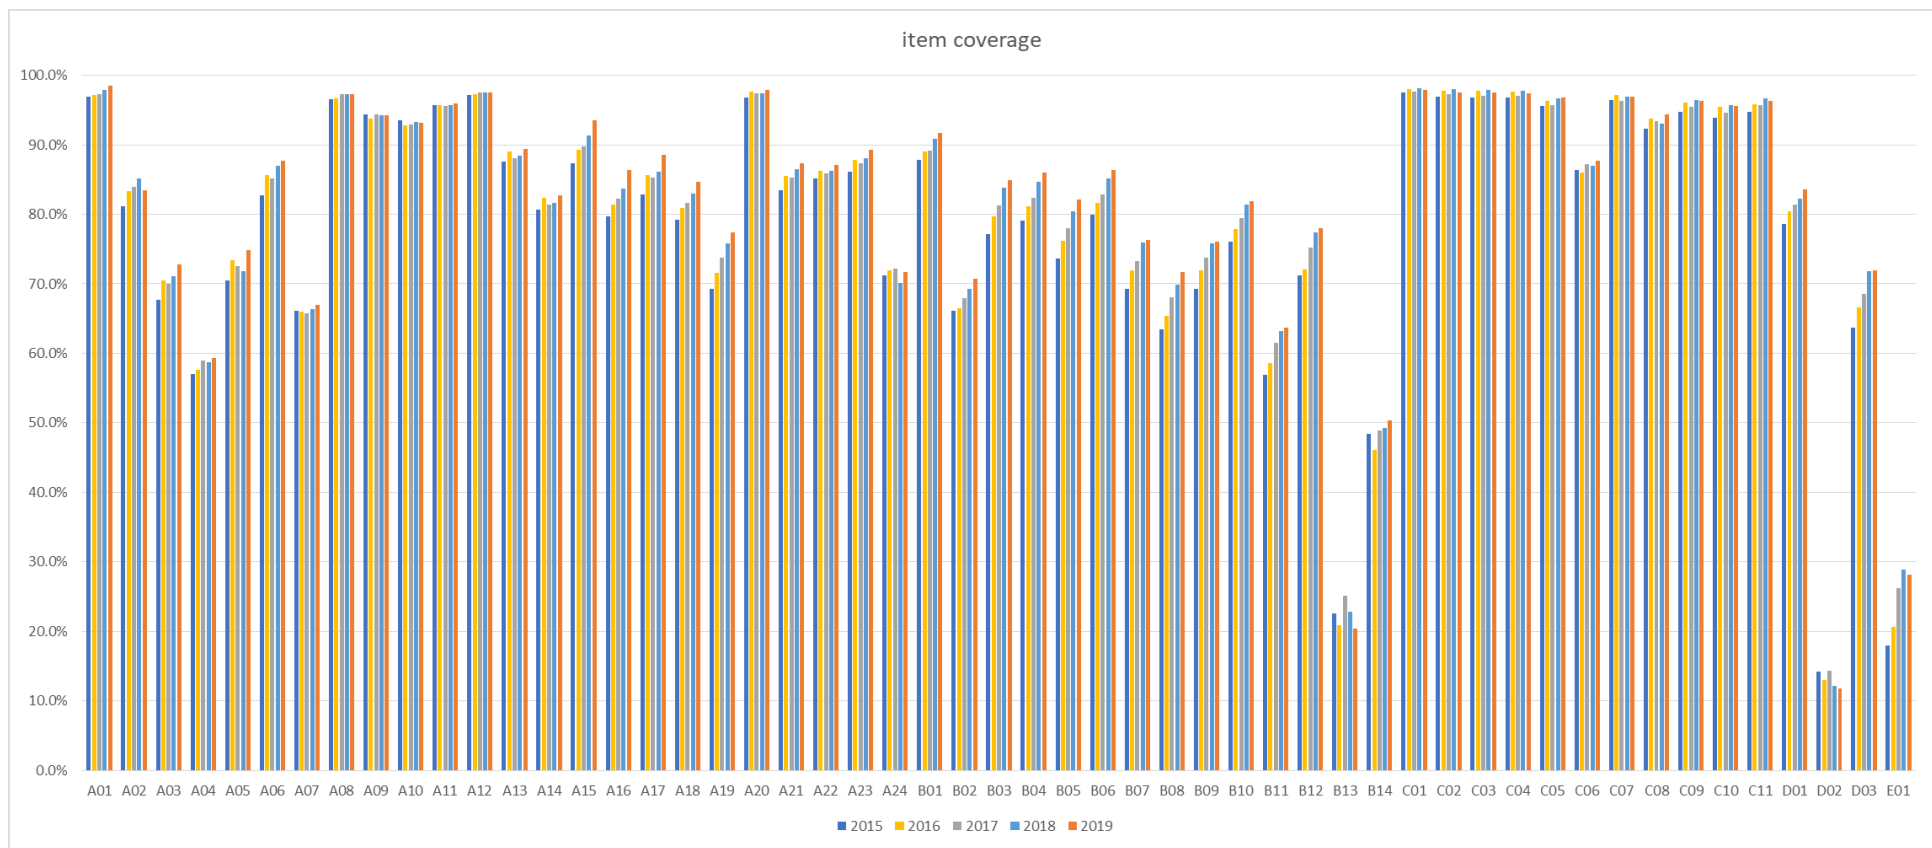

Also, as the items of the inspection instructions are not comparable, it is interesting to look at which items are more and more inspected each year. The coverage of the checklist item by item is provided in table 16. In October 2014, the checklist numbering of items was changed. For convenience the above-mentioned table only presents data from 2015 to 2019.

Table 16: Item of the checklist

Item	Description
<b>A</b>	<b>Flight Deck</b>
1	General Condition
2	Emergency Exit
3	Equipment
	<b>Documentation</b>
4	Manuals
5	Checklists
6	Radio Navigation Charts
7	Minimum Equipment List
8	Certificate of registration
9	Noise certificate (where applicable)
10	AOC or equivalent
11	Radio licence
12	Certificate of Airworthiness (C of A)
	<b>Flight data</b>
13	Flight preparation
14	Weight and balance
	<b>Safety Equipment</b>
15	Hand fire extinguishers
16	Life jackets / flotation device
17	Harness
18	Oxygen equipment
19	Independent portable light
	<b>Flight Crew</b>

20	Flight crew licence
	<b>Journey Log Book / Technical Log or equivalent</b>
21	Journey Log Book, or equivalent
22	Maintenance release
23	Defect notification and rectification
24	Pre-flight inspection
<b>B</b>	<b>Safety / Cabin</b>
1	General Internal Condition
2	Cabin attendant's station & crew rest area
3	First Aid Kit/ Emergency medical kit
4	Hand fire extinguishers
5	Life jackets / Flotation devices
6	Seat belt and seat condition
7	Emergency exit, lighting/marketing, independent portable light
8	Slides /Life-Rafts (as required), ELT
9	Oxygen Supply (Cabin Crew and Passengers)
10	Safety Instructions
11	Cabin crew members
12	Access to emergency exits
13	Safety of passenger baggage's
14	Seat capacity
<b>C</b>	<b>Aircraft Condition</b>
1	General external condition
2	Doors and hatches
3	Flight controls
4	Wheels, tyres and brakes
5	Undercarriage skids/floats
6	Wheel well
7	Power plant and pylon
8	Fan blades, Propellers, Rotors (main & tail)
9	Obvious repairs
10	Obvious un-repaired damage
11	Leakage
<b>D</b>	<b>Cargo</b>
1	General condition of cargo compartment
2	Dangerous Goods
3	Safety of cargo on board
<b>E</b>	<b>General</b>
1	General

Figure 6: item coverage (No. times items were checked in the year per No. of inspections performed in the year) 2015 - 2019

The graph shows that almost all items of the checklist were checked out more often during ramp inspections in 2019 than in 2018. Moreover, in most of the cases the trend is steady since 2015. This growth was particularly significant for cabin related items (B items) and items A15 to A19 that concerned emergency equipment installed in the cockpit.

Only items A02 “Emergency exits” and B13 “Stowage of passenger baggage” were inspected less often in 2019 than in 2018.

### 6.2.2.2 Aircraft configuration

The important difference in the item coverage rates may be justified by inspections performed on different aircraft configuration. In figure 7 are presented the main differences between inspection performed on passenger aircraft and cargo aircraft.

Figure 7: Item coverage rate per item – Cargo and Passenger aircraft

For cargo and passenger aircraft, the ramp inspection checklist coverage didn't change significantly between 2019 and 2018. We can see that A and C items are similarly inspected for cargo or passenger aircraft. As expected, the B items are less inspected on cargo aircraft.

Surprisingly, the D items related to cargo are not inspected in 100% of the ramp inspections performed on cargo aircraft. In the case of item D02, for example, some ramp inspectors will consider it as checked, only if dangerous goods are on board and they controlled it. For D03 some ramp inspectors will consider it as checked only if cargo was on-board. This highlights that there is no guidance to standardise when item D02 and D03 should be considered as "checked".

### 6.2.2.3 Type of operation

Another important difference in the item coverage rates may be justified by inspections performed on different type of operation. The main differences between inspection performed on Commercial and General Aviation are illustrated in figure 8.

Figure 8: Item coverage rate per item – General Aviation and Commercial Aviation

For a ramp inspection on Commercial Aviation, the number of items on the checklist covered during the inspection remains stable in 2019 compared to 2018.

The coverage of the checklist items during a ramp inspection on General Aviation remains stable for nearly all items, except for item A02 "Emergency exit" that was inspected 10% less in 2019 compared to 2018.

The main differences between checklist coverage rates are due to the lack of cabin crew requirements for most aircrafts involved in General Aviation and/or the size of module inspected. Therefore items A02 "emergency exits", B02 "Cabin attendant's station and crew rest area", B06 "Seat belt and seat condition", B07 "Emergency exit, lighting and independent portable lights", B08 "Slides/Life-Rafts (as required), ELT", B11 "Cabin crew members" and D03 "Cargo stowage" are significantly less checked out during inspections on General Aviation. The item D02 "Dangerous Good" is also very rarely controlled during an inspection performed on General Aviation.

## 7 Follow-up of ramp inspections

In addition to the collection and analysis of data, the Programme contributes actively to the improvement of aviation safety by:

1. informing the operator's Competent Authority of any significant (CAT2) or major (CAT3) finding raised on aircraft under their oversight;
2. ensuring immediate actions by the operator before flight when a major finding is raised including:
  - a. restriction on aircraft flight operation;
  - b. corrective actions before flight;
  - c. grounding of aircraft; and
  - d. immediate operating ban.
3. ensuring a follow-up of every significant and major finding after a ramp inspection.

Table 17: Actions after ramp inspections

Year of inspection		2018	2019
NOTIFICATION	No. of Inspections	12 232	11,657
	No. of Findings raised	7 192	6 419
	No of reports containing CAT2 or CAT3 findings	3 303	2 879
	No. of reports followed by an action Class 2: Information to the Authority & the Operator	10 601	10 129
	No. of reports containing CAT3 findings	1 584	1 339
IMMEDIATE ACTION	No. of reports containing at least one action Class 3a: Restriction on aircraft flight operation	142	131
	No. of reports containing at least one action Class 3b: Corrective actions before flight	1 516	1 258
	No. of reports containing at least one action Class 3c: Aircraft grounded	7	4
	No. of reports containing at least one action Class 3d: Immediate operating ban	1	0
FOLLOW-UP of findings	No. of findings CAT2 and CAT3 closed during the year (counting also findings raise previous year)	5 571	4 542

In 2018, 45 reports containing CAT2 or CAT3 findings were not notified to the Authority or the operators, in 2019 this figure was 16. Around 7 000 reports containing no CAT3 and no CAT2 findings were notified to Authority and Operator each year in 2018 and 2019 even if it was not required.

In 2018, 6 reports containing CAT3 findings were not followed by immediate corrective actions (class 3 actions), in 2019, 4 reports containing CAT3 findings were not followed by immediate actions.

In 2019, 4 aircrafts were grounded during a ramp inspection against 7 aircrafts in 2018. No aircraft was banned in 2019 and only one in 2018.

In 2019, Participating States closed around 4 542 findings category 2 or 3 while they closed 5 571 findings in 2018. This difference is mainly due to:

- the difference of the number of findings CAT2 and CAT3 raised in 2019 and in 2018 (4 254 findings CAT2 and CAT3 raised in 2019 and 5 171 in 2018); and
- an important number of findings raised before 2015 and closed in 2018 (438 findings).

Table 18: Number of findings closed per year

Year of inspection	Year of closure	
	2018	2019
2011	37	3
2012	82	34
2013	188	30
2014	142	37
2015	86	55
2016	116	86
2017	876	145
2018	4363	850
2019	Not applicable	3552
<b>Total</b>	<b>5890</b>	<b>4792</b>

On the 25<sup>th</sup> of May, 2020, 1 227 findings raised before 2020 were still open on the database.

Table 19: Number of findings

"OPEN"

Year of inspection	Number of findings OPEN
2011	8
2012	60
2013	62
2014	96
2015	97
2016	131
2017	174
2018	238
2019	361
<b>Total</b>	<b>1227</b>

Some findings are not closed because of various reasons notably:

- operators cannot be contacted after the inspection (Information on the owner may be inconclusive for operators flying without AOC, e.g.: flight performed with aircraft owned by banks or with shared ownership);
- the operator or the inspecting authority is not responsive; or
- the inspecting authority has not finalised its response.

This is analysed within the scope of the standardisation activity on a case by case basis.

## 8 Ramp inspection results

The analysis of inspection reports allows EASA to assess the operator's compliance with requirements, which is an important indicator for their safety performance.

### 8.1 General overview

*Table 20: Overview of the evolution of ramp inspection findings*

	Year						
	2013	2014	2015	2016	2017	2018	2019
<b>Total Inspections (I)</b>	11 679	11 630	12 040	12 475	13 156	12 232	11 657
<b>Total Inspected Items (II)</b>	467 408	476 833	499 186	525 239	558 653	525 181	504 486
<b>Total Findings (F)</b>	8 943	8 847	7 662	7 726	7 725	7 192	6 419
<b>Findings/ Inspections (F/I)</b>	0.77	0.76	0.64	0.62	0.59	0.59	0.55
<b>Findings/ Inspected Items (F/II)</b>	0.019	0.019	0.015	0.015	0.014	0.014	0.013

Figure 9: Inspected items and findings

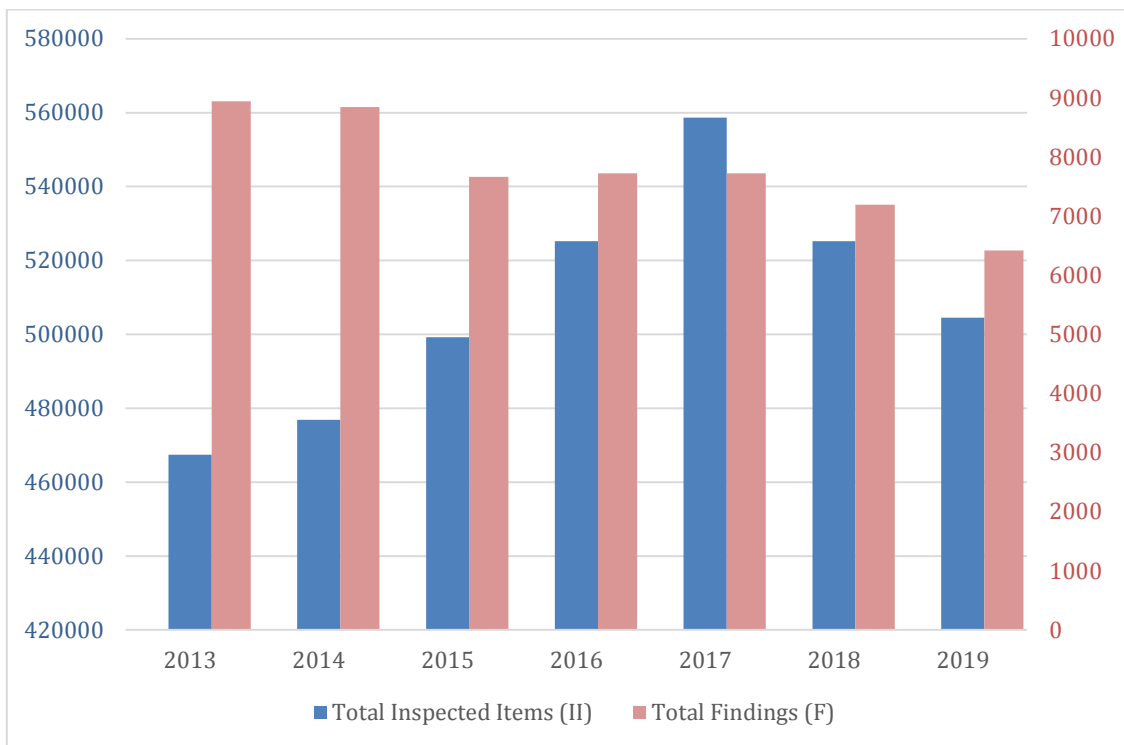

Figure 10: Findings per inspection and per inspected item

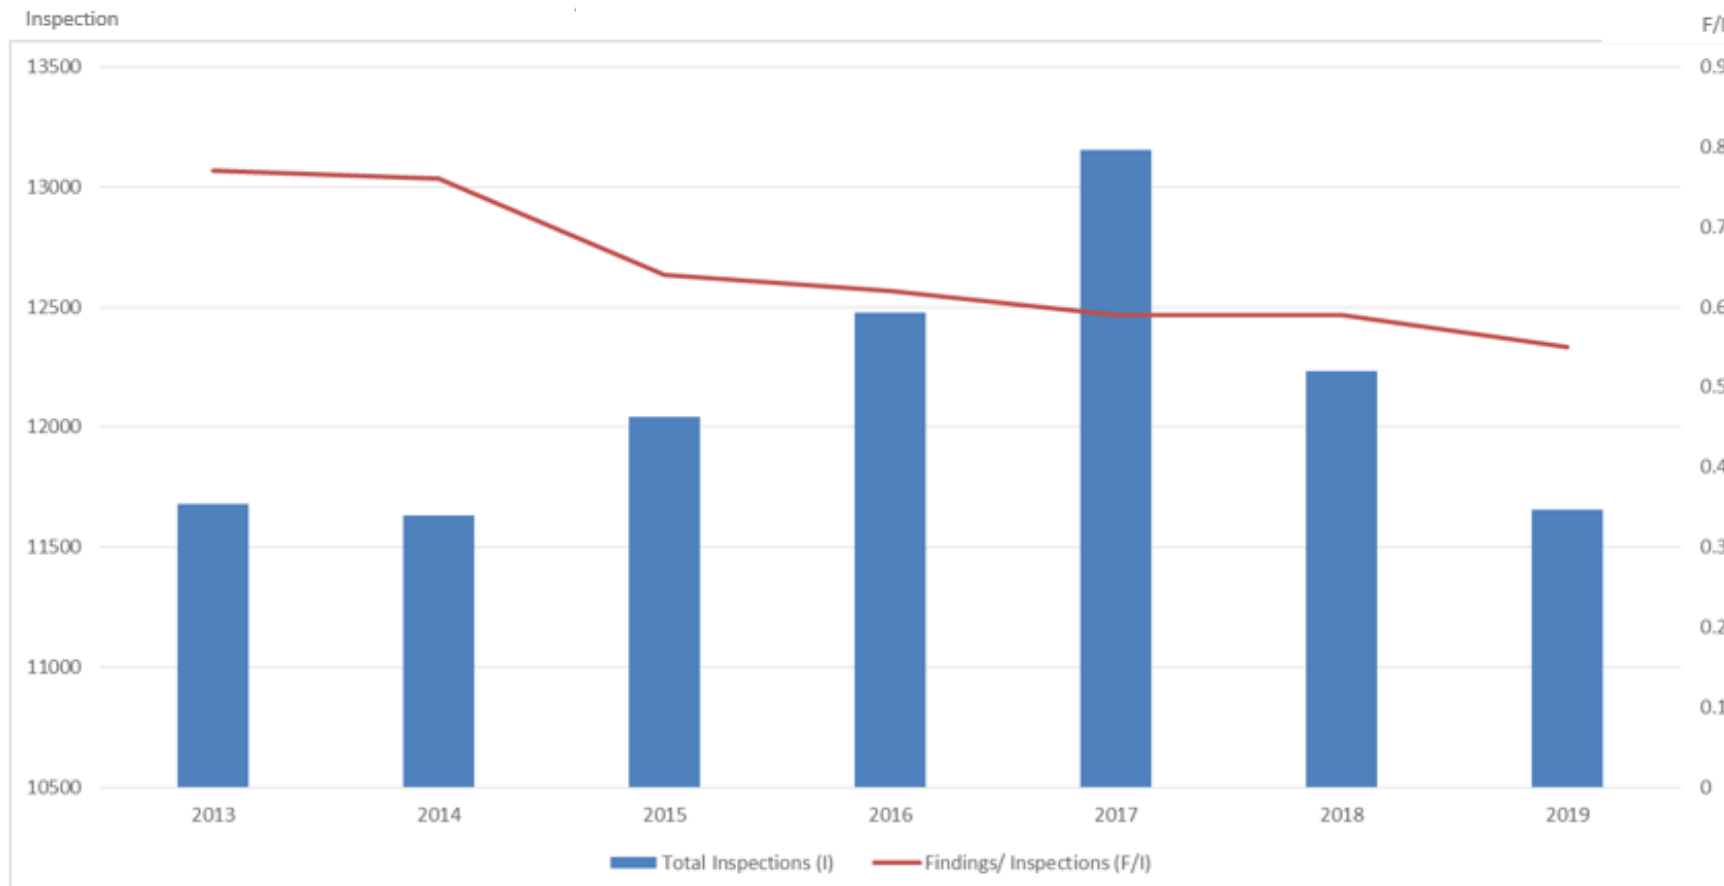

Figure 11: Annual inspections and average findings per inspection

The number of findings raised per inspection as well as the number of findings per inspected item continued to decrease in 2018 and 2019. It can be noticed that these trends are steady since 2011.

Table 21: Findings per category

			No. findings (F)				Ratio of findings per inspection (Fcat./I)				Ratio of findings per inspected items (F/I)	SAFA ratio
Year	No. inspections (I)	No. inspected items	Cat. 1 (minor)	Cat. 2 (significant)	Cat. 3 (major)	Total	F cat.1 / I	F cat.2 / I	F cat.3 / I	F total / I		
2017	13 156	558 653	2 201	3 404	2 120	7 725	0.167	0.259	0.161	0.587	0.014	0.65
			28.5%	44.1%	27.4%							
2018	12 232	525 181	2 021	3 081	2 090	7 192	0.165	0.252	0.171	0.588	0.014	0.63
			28.1%	42.8%	29.1%							
2019	11 657	504 486	2 165	2 581	1 673	6 419	0.186	0.221	0.144	0.551	0.013	0.54
			33.7%	40.2%	26.1%							

From the overview of the data provided in Table above, the following main information can be derived.

- Compared to 2017, 2018 showed a slight decrease in the total number of CAT1 findings; 2019 showed an increase of more than 5% in CAT1 findings. In both 2018 and 2019, CAT2 findings showed a constant decrease.
- In 2018, there was a slight decrease in the CAT3 findings followed by a higher decrease in 2019.
- The fluctuating trend showed by the number of CAT1 findings per inspection in the years 2017, 2018 and 2019 should be mostly ascribed to the re-categorisation of certain frequent non-compliances (e.g.: implementation of manufacturer data, waste receptacle access doors, etc...)

## 8.2 Results per geographical area

Table 22: Regional view of inspections performed

Region	No. of inspected Operators		Inspect. (I)		SAFA ratio	
	2018	2019	2018	2019	2018	2019
EASA Member States	642	625	6 686	6 429	0.45	0.42
EUROPE (ECAC)	786	765	7 862	7 456	0.46	0.43
Russian Federation, Belarus & Central Asia	62	65	698	623	0.59	0.44
North America	199	208	919	834	0.82	0.64
Latin America & the Caribbean	95	85	283	285	1.58	0.99
Middle East and North Africa	108	100	1 250	1 184	0.97	0.76
Africa	31	32	226	221	1.31	1.00
Asia	112	107	947	984	0.80	0.74
Oceania	20	21	47	70	0.59	0.87
All States					<b>0.63</b>	<b>0.54</b>

It should be noticed that operators from “Russian Federation, Belarus & Central Asia” and from “North America” improved their SAFA ratio in 2019 in comparison with 2018 respectively from 0.59 to 0.44 and from 0.82 to 0.64. Due to the large number of inspections on these operators and the wide number of States of inspections (see chapter 7.2), this result should be seen as a structural improvement of operators from this region.

Latin America and Caribbean average SAFA ratio significantly improved but mainly because of the reduction of the inspections performed on Venezuelan operators in 2019, 21 inspections performed in 2018 against 4 in 2019. Without taking into account Operators from Venezuela the SAFA ratio in 2018 of LAC would have been 1.07 and in 2019 0.97. The reduction of the number of inspections performed on Venezuelan operators in 2019 was mostly due to the closure of direct route between Venezuela and Aruba by Aruban authorities inducing a reduction of the number of inspections performed by Aruban inspectors on Venezuelan operators.

The SAFA ratio of African operators decreased significantly in 2019. Due to the low number of inspection on operators from Africa, the SAFA ratio of the region can be significantly influenced by few inspections with an important number of raised findings (e.g.: up to 20 category 3 findings raised on a single operator in

2019). If we filtered the results of inspections performed on tail number inspected only once, the SAFA ratio of AFR in 2018 would have been 0.95 and in 2019, 0.97.

The SAFA ratio of Oceania region increased in 2019, mainly because of less inspection performed by Singapore authorities on Australian operators with a low SAFA ratio and a more important number of inspections in Australia and New Caledonia on operators from Oceania with poor ramp inspection results.

LAC and AFR are still the regions whose operators have the highest rates of non-compliances in 2018 and 2019.

The improvement of the SAFA ratio of African and Latin American as well as the increasing SAFA ratio of Oceania operators should not be considered as indicators of a structural safety improvement or degradation. Indeed, the low number of inspections performed on operators from these regions lower the statistical significance (e.g.: one inspection with an important number of CAT2 and CAT3 could significantly alter this regional indicator).

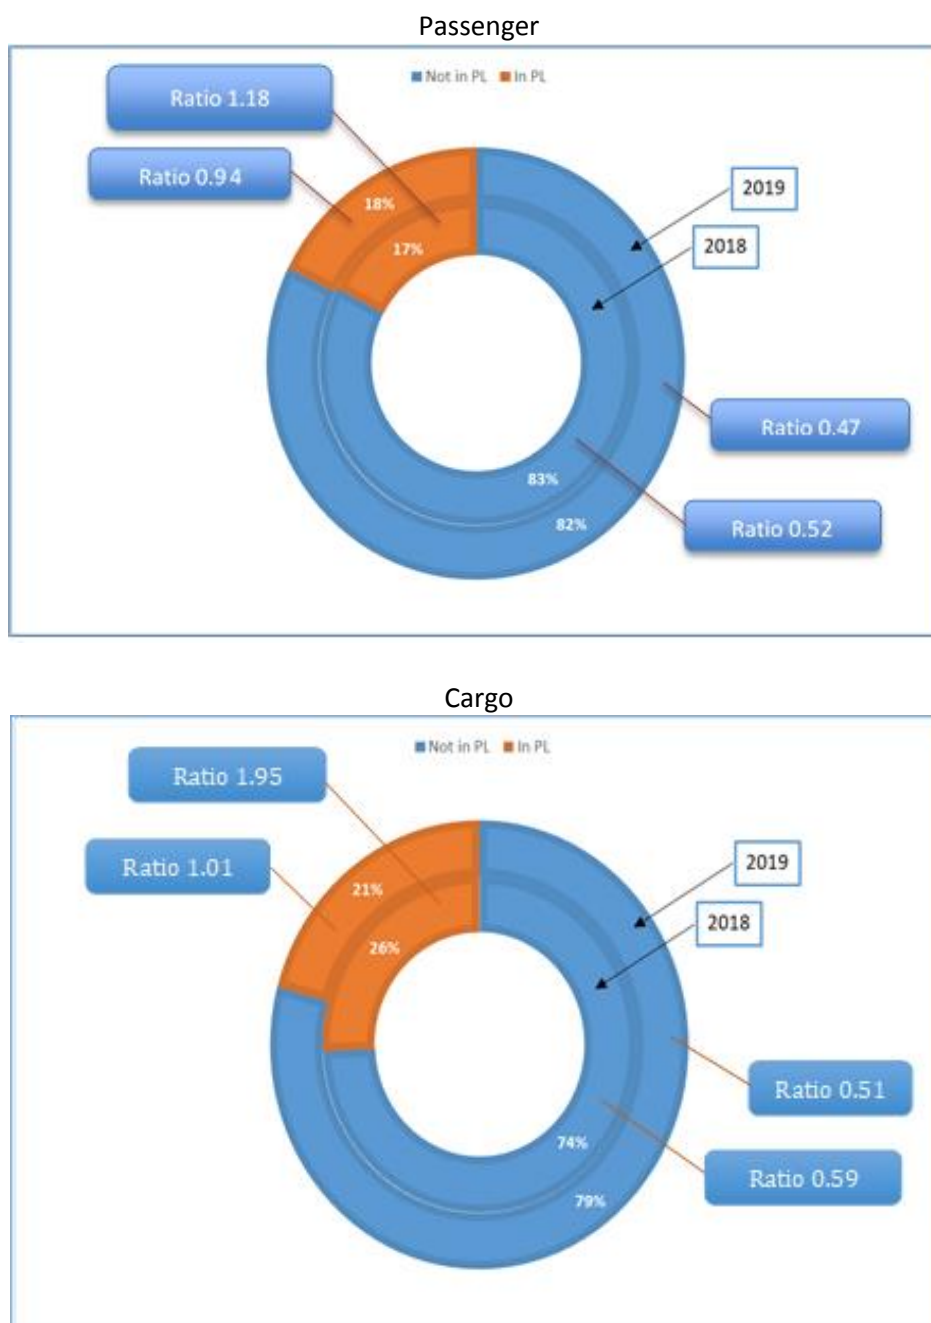

### 8.3 Results per aircraft configuration

In 2018 and 2019, 16 and 13 inspections were performed on “combi” aircraft. These numbers are considered too low to deem an analysis and are not considered in this chapter.

Table 23: Ramp inspection results per aircraft configuration - Passenger and cargo

Aircraft configuration	Cargo		Passenger	
Year of inspection	2018	2019	2018	2019
Number of inspections	949	981	11 267	10 663
<i>% of the total number of inspections</i>	8%	8%	92%	91%
Number of inspections on prioritised cargo aircraft	243	204	1 950	1 883 (18%)
<i>% of inspection on prioritised aircraft per aircraft configuration</i>	26%	21%	17%	18%
State of inspection	44	45	47	47
Number of tail number inspected	572	583	6 867	6 635
Number of operators	145	126	1 350	1 315
No. of CAT1	137	159	1 881	2 002
No. of CAT2	264	229	2 810	2 349
No. of CAT3	226	140	1 860	1 529
Ratio	0.85	0.58	0.61	0.53

Figure 12: Operator SAFA ratio and Priority List – Passenger and cargo configuration

The SAFA ratio of both configuration group decreases from 2018 to 2019. For passenger aircraft it is a reduction from 0.61 to 0.53 (-13.1%), and for cargo aircraft from 0.85 to 0.58 (-31.8%).

For passenger aircraft, the proportion of inspection performed on prioritised and non-prioritised aircraft is similar between 2018 and 2019.

For cargo aircraft, a lesser proportion of prioritised aircraft was inspected in 2019 compared to 2018. The significant improvement of the prioritised cargo aircraft SAFA ratio should be noted, in 2019 the SAFA ratio of cargo aircraft reached the level of the SAFA ratio of passenger aircraft.

The SAFA ratio of prioritized cargo operators in 2018 was significantly higher than in 2019 due to 5 aircrafts with a SAFA ratio over 10 and inspected only once in 2018. Without considering tail number with a SAFA ratio over 10 the SAFA ratio would be as follows:

*Table 24: SAFA ratio without taking into account aircrafts inspected only once with a SAFA ratio over 10*

Cargo aircraft on the PL	2018	2018 (without taking into account tail number with a SAFA ratio over 10 inspected only once)	2019	2019 (without taking into account tail number with a SAFA ratio over 10 inspected only once)
SAFA Ratio	1.95	1.22	1.01	1.01
Number of inspections	243	238	204	204

Figure 13: No. of findings (CAT2 + CAT3) per No. of times items were checked – Cargo and passenger

The main areas of concerns for passenger aircraft and cargo aircraft are similar.

- Items A04 to A07 related to the document management of operators (“Manuals”, “checklists”, “Navigation/instrument Charts”, “Minimum Equipment List”).
- Items A13 “flight preparation” and A14, “mass and balance calculation”.

- Item A23 "Defect notification and rectification (incl. Tech Log)".
- Item B01 "general internal condition".
- Item C01 "external condition".
- Items D01 "General condition of cargo compartment" and D03: "Cargo stowage".

For cargo aircraft, the item B13 "stowage of passenger baggage" is also considered as an area of concerns.

Table 25: Top 5 major findings - Cargo and passenger

2018 Top 5 CAT3 Cargo configuration			2019 Top 5 CAT3 Cargo configuration		
<b>D03</b>	Cargo not correctly secured and restrained in all directions	33	<b>D03</b>	Cargo not correctly secured and restrained in all directions	17
<b>A01</b>	Interior equipment and/or other object(s) not correctly secured or stowed during flight	12	<b>B01</b>	Loose or heavy objects in the cabin/galleys	12
<b>B01</b>	Loose or heavy objects in the cabin/galleys	10	<b>A01</b>	Interior equipment and/or other object(s) not correctly secured or stowed during flight	5
<b>C07</b>	Screws/rivets loose or missing, outside dispatch limits/conditions	9	<b>D01</b>	Damage to panelling and/or lining outside limits	5
<b>B01</b>	Crew carry-on baggage not adequately and securely stowed during flight	5	<b>A23</b>	Required maintenance action not performed or not in accordance with applicable (MEL/AMM/SRM) instructions	5

2018 Top 5 CAT3 Passenger configuration			2019 Top 5 CAT3 Passenger configuration		
<b>D03</b>	Cargo not correctly secured and restrained in all directions	158	<b>D03</b>	Cargo not correctly secured and restrained in all directions	153
<b>B01</b>	Galley/lavatory waste receptacle access door cover inoperative (outside dispatch limits/conditions)	87	<b>D03</b>	Load distribution/load limit (floor and/or height) exceeded	61
<b>D03</b>	Load distribution/load limit (floor and/or height) exceeded	82	<b>D01</b>	Blow-out panels pushed, damaged or missing (outside dispatch limits/conditions)	60
<b>A01</b>	Interior equipment and/or other object(s) not correctly secured or stowed during flight	59	<b>D01</b>	Damage to panelling and/or lining outside limits	49
<b>B06</b>	Seat(s) unserviceable and not identified as such	55	<b>A01</b>	Interior equipment and/or other object(s) not correctly secured or stowed during flight	47

In both 2018 and 2019, the PDF CAT3 "Cargo not correctly secured and restrained in all directions" was the most raised on both aircraft configurations. Along these 2 years, the finding was raised 361 times. In 2019, the firsts four of the top five raised PDFs on passenger aircraft were related to the cargo inspection items and represented 323 CAT3 findings i.e.: 20% of all CAT3 findings.

It should be noted that the CAT3 PDF B01 "Galley/lavatory waste receptacle access door cover inoperative (outside dispatch limits/conditions)" has been re-categorised as a CAT2 finding in September 2019 when it concerned a defect in the galley.

The pre-described finding A01 “Interior equipment and/or other object(s) not correctly secured or stowed during flight” mostly concerned luggage or bag stowed in the cockpit without restraints.

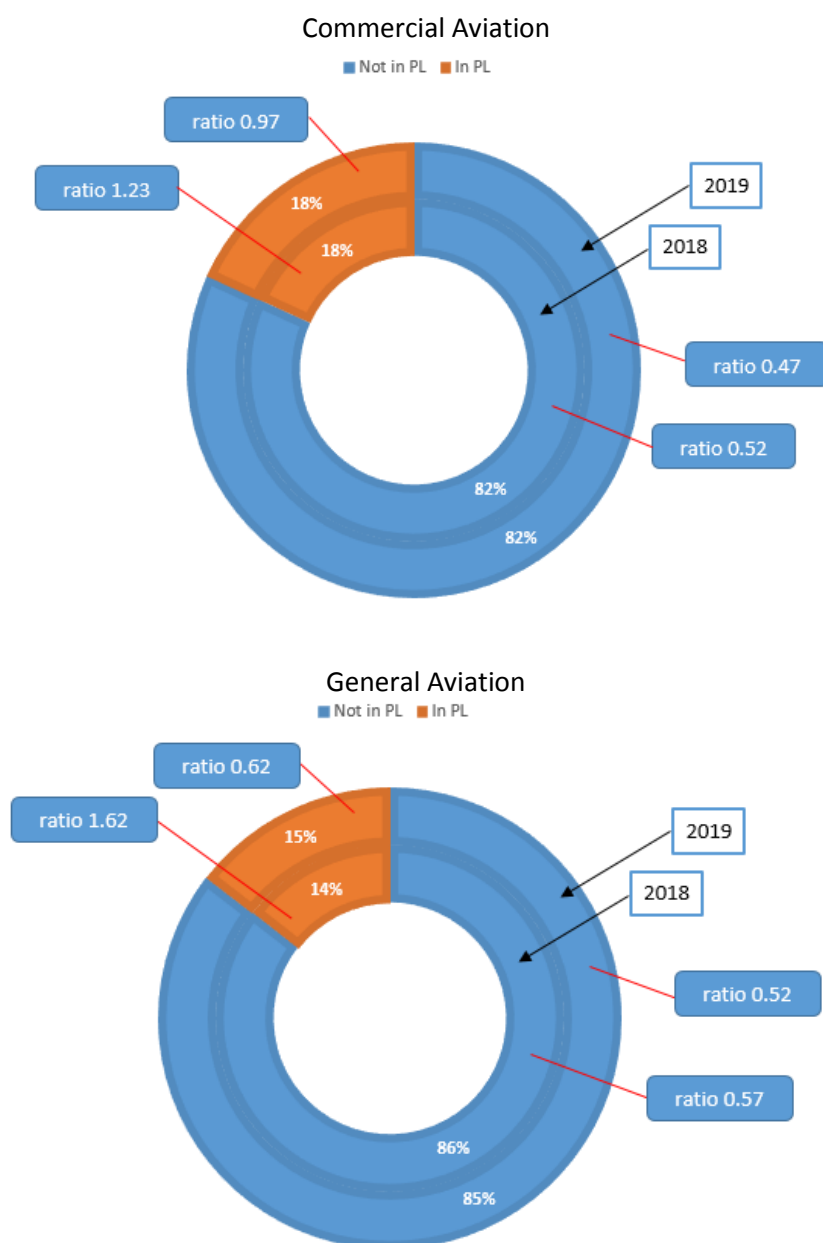

## 8.4 Results per type of operation

*Table 26: Ramp inspection results per type of operation- Commercial Aviation and General Aviation*

Type of operation	Commercial Aviation		General Aviation	
Year of inspection	2018	2019	2018	2019
Number of inspections	11 430	10 962	802	695
<i>% of the total number of inspections</i>	93%	94%	7%	6%
Number of inspections on prioritised aircraft	2 079	1 989	116	101
<i>% of inspection on prioritised aircraft per type of operation</i>	18%	18%	14%	14%
States of inspections	47	47	37	34
No. of tail number inspected	6 726	6 608	706	629
No. of operators inspected	1 127	1 069	401	431
No. of CAT1	1 926	2 075	95	90
No. of CAT2	2 816	2 415	265	166
No. of CAT3	1 948	1 575	142	98
Ratio	0.65	0.58	0.71	0.53

It should be noted that an important number of Participating States including the EASA Member States did not perform inspection on General Aviation and only 19 Participating States performed inspections on prioritised aircraft operated in General Aviation.

Figure 14: Operator SAFA ratio and Priority List – Commercial Aviation and General Aviation

The proportion of inspections on prioritised aircraft is stable for both types of operations. The SAFA ratio is still decreasing notably the SAFA ratio resulting from inspections performed on aircraft included in the Priority List. The SAFA ratio decrease resulting from inspection performed on aircraft in the Priority List operated in General Aviation is particularly significant. A part of this decrease is due to fewer inspections performed in Aruba in 2019 compared to 2018 while the SAFA ratio resulting from inspections performed in 2018 by Aruban ramp inspectors was particularly high. This reduction was a consequence of the decrease number of inspections on Venezuelan operators due to the closure of direct routes between Venezuela and Aruba by Aruban authorities.

Table 27: SAFA ratio of aircraft on the Priority List operated in General Aviation without taking into account aircrafts inspected in Aruba

General Aviation on the Priority List	2018	2018 (without Aruban inspections)	2019	2019 (without Aruban inspections)
SAFA ratio	1.62	1.02	0.62	0.61
Number of inspections	116	108	101	100

Figure 15: No. of findings (CAT2 + CAT3) per No. of times items were checked – General Aviation and Commercial Aviation

The main areas of concerns for Commercial Aviation are:

- Items A04 to A07 related to the document management of operators ("Manuals", "checklists", "Navigation/instrument Charts", "Minimum Equipment List")
- Items A13 "flight preparation" and A14 "mass and balance calculation"
- Item A23 "Defect notification and rectification (incl. Tech Log)"
- Item B01 "general internal condition"
- Item C01 "external condition"
- Items D01 "General condition of cargo compartment" and D03 "Cargo stowage"

The main areas of concerns for General Aviation are:

- Items A04 to A07 related to the document management of operators ("Manuals", "checklists", "Navigation/instrument Charts", "Minimum Equipment List")
- Items A13 "flight preparation" and A14 "mass and balance calculation" Item A23 "Defect notification and rectification (incl. Tech Log)"
- Item B01 "general internal condition"

Table 28: Top 5 major findings - Commercial Aviation

2018 Top 5 CAT3 Commercial Aviation			2019 Top 5 CAT3 Commercial Aviation		
<b>D03</b>	Cargo not correctly secured and restrained in all directions	191	<b>D03</b>	Cargo not correctly secured and restrained in all directions	170
<b>B01</b>	Galley/lavatory waste receptacle access door cover inoperative (outside dispatch limits/conditions)	90	<b>D01</b>	Blow-out panels pushed, damaged or missing (outside dispatch limits/conditions)	63
<b>D03</b>	Load distribution/load limit (floor and/or height) exceeded	87	<b>D03</b>	Load distribution/load limit (floor and/or height) exceeded	62
<b>A01</b>	Interior equipment and/or other object(s) not correctly secured or stowed during flight	71	<b>D01</b>	Damage to panelling and/or lining outside limits	54
<b>B06</b>	Seat(s) unserviceable and not identified as such	56	<b>A01</b>	Interior equipment and/or other object(s) not correctly secured or stowed during flight	52

In both 2018 and 2019, the CAT3 PDF "Cargo not correctly secured and restrained in all directions" was the most raised. Along these 2 years, the finding was raised 361 times. In 2019, the first four subjects of the top 5 major findings were findings related to cargo items, they represented 323 CAT3 findings i.e.: 20% of all CAT3 findings.

It should be noted that the CAT3 PDF B01 "Galley/lavatory waste receptacle access door cover inoperative (outside dispatch limits/conditions)" has been re-categorised as a CAT2 finding in September 2019 when it concerned a defect in the galley.

The pre-described finding A01 "Interior equipment and/or other object(s) not correctly secured or stowed during flight" mostly concerned luggage or bags stowed in the cockpit without restraint.

## 9 Conclusions

1. Over 2018 and 2019, the Programme continued to expand. As a result of Australia becoming a full member, the number of inspected operators certified in the ASIA or OCEANIA regions increased.
2. EASA has consistently provided the Participating States with a list of operators identified as presenting a potential risk for the prioritisation of ramp inspections while taking into account a large number of criteria.
  - The criteria considered in the Priority List relied on different external sources, while for some of these external sources, shortcomings were revealed in this analysis. ICAO USOAP reports can be outdated and the Level of Effective Implementation reduces the oversight performance of a State to one single value. Also, the FAA categorisation is a criterion which does not guarantee a level playing field amongst operators, as it is not available for all States.
  - A separate chapter within this priority list has been dedicated to newly authorised third country operators, which includes operators not inspected in the last 12 months. The analysis in this report shows the large representation of the latter group within this population, risking the effective prioritisation of newly authorised third country operators.
  - A strong connection between the Priority List and the Air Safety List was present. However, the connection could be enhanced to address the fact that a list of States subject to active consultation is not available and that the recitals of the Air Safety List update only cover a State when it is part of the agenda of the Air Safety List committee meeting.
  - A large part of operators analysed by IDEA experts was not inspected sufficiently to support a proper analysis
3. The number of inspections per prioritised tail number was slightly higher than the number of inspections performed per non prioritised tail number.
4. The SAFA ratio appeared too sensitive to a low number of inspections with very bad results.
5. In 2019 several structural changes were implemented in the Programme. The associated projects were led by experts seconded to EASA by the competent authorities and Working Groups populated with experts from the competent authorities.
  - The creation of the standing PDF WG transformed the way EASA manages the Inspection Instructions and the RIM. Now, this task is more outsourced and performed continuously by the PDF WG under EASA coordination.
  - The implementation of SWC reduced the workload for competent authorities in developing the annual programme for the conduct of ramp inspections. Now, EASA provides the risk-based target of inspections for Layer 1 operators and ensures the necessary update of these targets and the coordination between States for their achievement.
6. EASA and the Participating States coordinated the number of performed inspections efficiently and more closely.
  - In 2018 and 2019 the number of inspections decreased in line with the overall improvement of the SAFA ratio. This didn't happen since 2012.
  - In 2018, despite a higher SAFA ratio, the cargo operators were inspected less often than passenger operators, this was no longer the case in 2019. Indeed in 2019, cargo and passenger operators had a similar SAFA ratio and were inspected at almost the same frequency.
  - The traffic of operators inspected by EASA Member States represented more than 90% of the number of landings recorded by Eurocontrol.

7. The added safety value of the Programme becomes clear when looking in particular to the following:
  - ramp inspection results improved due to the re-categorisation of findings in 2019. However, the global indicators show a structural improvement of Layer 1 operators' ratio since the end of 2016.
  - The centralised establishment of risk-based inspection targets led to the desired result of less over-inspection and less under-inspection of operators, leading to better balanced inspection numbers depending on the operator's risk footprint.
8. The cargo items still provided the highest number of CAT3 findings:
  - For Commercial Aviation In 2019, the top 4 raised CAT 3 PDFs were pre-defined findings related to cargo items;
  - They represented 323 CAT3 findings (i.e. 20% of all CAT3 findings).

## 10 Recommendations

1. The international expansion should aim at further increasing the number of operators inspected within the Programme by enhancing the global world coverage. An expansion to the ASIA, OCEANIA and LATIN AMERICA regions may serve that purpose.

*Linked to conclusion 1*

2. The following shortcomings of the Priority List criteria should be corrected:
  - The pollution of operators not inspected in the last 12 months in Chapter 5 of the Priority List should be corrected;
  - The usage of input from ICAO USOAP reports as criteria should be reconsidered;
  - The process to include States on an ad-hoc basis when these are subject to active consultations under Regulation (EC) No 2111/2005 has to be improved, requiring an enhanced communication with the European Commission;
  - Criteria, such as the FAA categorisation, which are not available for all States should be reviewed.

*Linked to conclusion 2*

3. The methodology to establish the SAFA ratio should be reviewed.

*Linked to conclusion 4*

4. EASA should use the SAFA programme to pro-actively improve the safety of aviation. This may be achieved by establishing a process to follow-up on area of concerns determined by the number of major findings raised during ramp inspections. The cargo related CAT3 findings should be used as a pilot case.

*Linked to conclusion 8*
